#### Abstract

The Cosmetic Ingredient Review Expert Panel (Panel) assessed the safety of 237 alkyl esters for use in cosmetics. The alkyl esters included in this assessment have a variety of reported functions in cosmetics, with skin-conditioning agent being the most common function. The Panel reviewed available animal and clinical data in making its determination of safety on these ingredients, and where there were data gaps, similarity in structure, properties, functions, and uses of these ingredients allowed for extrapolation of the available toxicological data to assess the safety of the entire group. The Panel concluded that these ingredients are safe in cosmetic formulations in the present practices of use and concentration when formulated to be nonirritating.

#### **Keywords**

alkyl esters, safety, cosmetics

# Introduction

Cetyl esters is indicated in the International Cosmetic Ingredient Dictionary and Handbook as a synthetic wax composed of a mixture of esters of saturated fatty acids and fatty alcohols with carbon chain lengths between 14 and 18.<sup>1</sup> The Cosmetic Ingredient Review (CIR) Expert Panel (Panel) reviewed this ingredient in 1997 and concluded that cetyl esters is safe as used in cosmetics.<sup>2</sup>

Cetyl esters is a constituent of a broader group of cosmetic ingredients, the alkyl esters, which consist of the reaction products of fatty acids and alcohols. The 237 alkyl esters being reviewed in this safety assessment are presented alphabetically in Table 1. Although 57 of these alkyl esters have been reviewed previously by the Panel, they are included because their structural and functional similarities allow for the grouping of all alkyl esters, thereby creating a complete family.

The conclusions reached for the previously reviewed ingredients (including cetyl esters), along with summaries of the data included in those existing safety assessments, are provided in Table 2.<sup>2-22</sup> Only new data available for these alkyl esters are included in the text of this safety assessment to support the safety of this class of cosmetic ingredients.

In addition, the Panel previously concluded that many of the individual constituents that make up the alkyl esters (ie, the alcohol and/or the acid), are safe as used in cosmetics. Because the safety of the individual constituents may be relevant to the safety of the ester, Table 3 indicates whether all, one, or none of the individual constituents of each alkyl esters have been found safe for use in cosmetics, and Table 4 provides the conclusions previously reported for those individual compo-nents.<sup>4,8,9,11,12,17,23-35</sup> Data on the individual constituents are available in the existing CIR safety assessments and are not summarized here; however, the reported maximum concentration of use is provided to reflect contextual constraints.

# Chemistry

### Definition and Structure

The ingredients in this review are alkyl esters. The core relationship between these ingredients is a carboxyl ester functional group flanked on both sides by extended alkyl chains. Some of these alkyl chains are saturated and some are unsaturated, and some of the chains are straight and some branched. Formal definitions for the ingredients included in this assessment are provided in Table 5.<sup>1</sup>

Alkyl ester	Conclusion (year)	Summary data	Reference
	fety assessment of arachidyl		
Arachidyl	Safe as used (1990;	- The acute oral LD <sub>50</sub> in rats was >20 g/kg; up to 2500 mg/kg at concentrations	3,4
propionate	reaffirmed 2008)	of 25% in corn oil was not toxic in a 90-day oral study – The acute dermal LD <sub>50</sub> in rabbits was > 2 g/kg	
		<ul> <li>– The acute definial LD<sub>50</sub> in rabbits was &gt; 2 grkg</li> <li>– Not a primary irritant to rabbit skin when tested undiluted, a formulation</li> </ul>	
		containing 7% was not irritating in a 24-hour SIOPT, and a 10% solution was	
		nonirritating and undiluted test article was slightly irritating in a cumulative	
		irritation test; not a sensitizer when injected undiluted test material and was	
		not comedogenic when tested undiluted	
		- Undiluted test material and a formulation containing 7% were not irritating to	
Final report on the an	nended safety assessment of	rabbit eyes myristic acid and its salts and esters as used in cosmetics (2010)	
	fety assessment of butyl myr		
		- Discussion item: data on myristic acid myristyl and isopropyl myristate were	5
<b>-</b>		extrapolated and also used in the determination of safety (1990 report)	5,22
Butyl myristate	Safe as used (1990; 2010)	- Was observed to enhance dermal penetration of some chemicals	5,22
		<ul> <li>The oral LD<sub>50</sub> in rats was &gt;8 g/kg</li> <li>A single application of 2 g/kg was nontoxic and nonirritating in rabbits</li> </ul>	
		<ul> <li>A single application of 2 g/kg was noncosic and nonirritating in rabbits</li> <li>A 24-hour occlusive application of undiluted test material produced moderate</li> </ul>	
		irritation (PII = 2.88) in rabbits; a moderate irritant but not a sensitizer in	
		guinea pigs when injected intradermally	
		– Nonirritating to rabbit eyes	
Cetyl myristate	Safe as used (2010)	– No data were available	5
Decyl myristate	Safe as used (2010)	– No data were available	5
	e Safe as used (2010)	– No data were available	5
lsobutyl myristate	Safe as used (2010)	– No data were available	5
Isocetyl myristate	Safe as used (2010)	– No data were available	5
lsodecyl myristate lsopropyl myristate	Safe as used (2010) Safe as used (1982; 2010)	<ul> <li>No data were available</li> <li>In a study in which monkeys were exposed for 5 seconds to an aerosol</li> </ul>	5,6
isopi opyr myristate	Sale as used (1702, 2010)	antiperspirant containing an unspecified concentration of [ <sup>14</sup> C]isopropyl	
		myristate, the distribution in the exhaled air and in several tissues indicated	
		only 0.25% of the sprayed dose was absorbed and about 10% of this reached	
		the lower respiratory tract	
		– The acute oral $LD_{50}$ was >16 mL/kg in rats and 49.7 mL/kg in mice	
		- The acute dermal $LD_{50}$ in rabbits was 5 g/kg; dermal application of 2 g/kg a	
		formulation containing 16%-20% in rabbits for 26 days (20 applications) did	
		not produce signs of toxicity but did cause severe erythema and moderate edema and other dermal effects and microscopically marked to severe	
		acanthosis and hyperkeratosis and mixed inflammatory cell infiltration;	
		application of 2 mL/kg of a formulation containing 43%-47% in rabbits for 4	
		weeks (21 applications) produced erythema, edema, drying, cracking, and	
		fissuring, but microscopic effects were only seen at the application site	
		- I-hour inhalation exposure to formulations containing 16%-20% (33-41 mg/L)	
		and 4.7% (9.7 mg/L) did not produce any deaths or evidence of systemic	
		toxicity in rats; in 13-week inhalation studies, a formulation containing 16%-	
		20% was not toxic to guinea pigs (daily mean concentration of $63.3-224 \text{ mg/m}^3$	
		air for three 1-hour exposures/d) but did produce coughing and wheezing in monkeys. Macrophage accumulations within the alveolar and bronchiolar	
		walls were seen in the lungs in direct proportion to the dosage of the aerosol	
		$(5.3-37.0 \text{ mg/m}^3 \text{ in air})$	
		- A 50% solution in isopropyl alcohol significantly accelerated the carcinogenic	
		activity of 0.15% benzo[a]pyrene on the skin of mice; no tumors were	
		produced in mice by application of a 1% solution for 18 weeks; applications of	
		10%-100% to the backs of Swiss mice $2 \times / wk$ did not result in test article-	
		related carcinogenic lesions	
		- In Draize tests, undiluted test material and 15%-58% in formulations was at mostly minimally irritating to the skin of rabbits, however, application of	
		mostly minimally irritating to the skin of rabbits, however, application of undiluted test material for 3 days was moderately to severely irritating,

Alkyl ester	Conclusion (year)	Summary data	Referenc
		<ul> <li>In human testing, 20% active and undiluted test material had very good skin compatibility in a 24-hour SIOPT (21 subjects); a formulation containing 1.5% was not a contact allergen in a maximization test (25 subjects) and undiluted test material was not an irritant or sensitizer in a provocative RIPT (20 eczema patients)</li> </ul>	
Cetearyl nonanoate	Safe as used (2010)	- 10% active was not irritating to rabbit eyes - The oral LD <sub>50</sub> in rats was 2 g/kg	9
,	( )	<ul> <li>The acute dermal LD<sub>50</sub> in rats was &gt;2 g/kg, and there was no dermal irritation observed</li> </ul>	
		<ul> <li>Undiluted test material (97% pure) was nonirritating to rabbit skin; not a sensitizer in a GPMT (10% for intracutaneous induction, 50% for topical induction, 10% at challenge, sesame oil was the vehicle)</li> </ul>	
		<ul> <li>Not mutagenic in an Ames test at doses up to 5000 μg/plate with or without metabolic activation</li> </ul>	
		<ul> <li>In human testing, undiluted test material (97% pure) was not an irritant in a 48-hour SIOPT (52 subjects); undiluted test material was not an irritant or a sensitizer in an RIPT (106 subjects)</li> </ul>	
<b>a</b> 1.		- Undiluted test material was minimally irritating to rabbit eyes	9
Cetyl isononanoate Ethylhexyl	Safe as used (2010) Safe as used (2010)	– No data were available – Not mutagenic in an Ames test at doses up to 5000 μg/plate with or without	9
isononanoate		metabolic activation – In human testing, undiluted test material did not indicate potential for allergic	
		contact sensitization in an RIPT (10 subjects)	9
Ethylhexyl	Safe as used (2010)	- The acute oral LD <sub>50</sub> in rats was >5 g/kg	9
pelargonate		- Undiluted test material was not irritating to rabbit skin ( $PII = 0.40$ )	
Isobutyl pelargonate	Safe as used (2010)	<ul> <li>Undiluted test material was not irritating to rabbit eyes</li> <li>No data were available</li> </ul>	9
Isodecyl isononanoate	Safe as used (2010)	<ul> <li>In human testing, a formulation containing 51.35% was not an irritant or sensitizer in an RIPT (101 subjects) and a formulation containing 2.6% was not</li> </ul>	9
lsononyl isononanoate	Safe as used (2010)	a contact allergen in a maximization test (26 subjects) – The acute oral LD <sub>50</sub> in rats was >5 g/kg; 300 and 1000 mg/kg/d induced mortality and all doses (100-1000mg/kg/d) induced liver and kidney toxicity in a 4-week oral study in rats	9
		<ul> <li>- 300 mg/kg/d (2 weeks) and 860 mg/kg/d (8 days) induced liver and adrenal gland toxicity in a dermal study in rats</li> </ul>	
		<ul> <li>Not embryotoxic or fetotoxic in rats dosed by gavage with 300 mg/kg/d on days 6-17 postcoitum</li> </ul>	
		<ul> <li>Not mutagenic in an Ames test at doses up to 5000 μg/plate with or without metabolic activation</li> </ul>	
		<ul> <li>Slightly irritating to rabbit skin (study details not provided)</li> <li>In human testing, lipstick formulations containing 3.552% (53 subjects) and</li> </ul>	
		3.128% (97 subjects) were not irritants or sensitizers in RIPTs and a formulation containing 24.66% was not a contact allergen in a maximization	
		test (26 subjects) – Not irritating to rabbit eyes (concentration tested was not stated)	
lsostearyl isononanoate	Safe as used (2010)	– No data were available	9
Isotridecyl isononanoate	Safe as used (2010)	<ul> <li>In human testing, a formulation containing 4.3% was not a contact allergen in a maximization test (28 subjects)</li> </ul>	9
Tridecyl isononanoate	Safe as used (2010)	– No data were available	9
	ety assessment of cetyl e	sters	
Cetyl esters	Safe as used (1997)	<ul> <li>– (Synonymous with synthetic spermaceti wax) a commercial cetyl esters preparation comprised of a mixture of one or more of the following esters: cetyl palmitate, myristyl myristate, cetyl stearate, myristyl stearate, cetyl myristate, and stearyl stearate</li> </ul>	2
		<ul> <li>The oral LD<sub>50</sub> in mice of a formulation containing 60%-65% was &gt;20 g/kg</li> <li>A formulation containing 60%-65% was not irritating to rabbit skin in a 24-hour SIOPT</li> </ul>	

Table 2. (continued)

Alkyl ester	Conclusion (year)	Summary data	Referenc
		<ul> <li>A formulation containing 60%-65% was not an irritant to rabbit eyes</li> <li>Discussion item: data from the safety assessments on cetyl palmitate, myristyl myristate, cetyl stearate, and myristyl stearate were extrapolated to determine safety</li> </ul>	
Final report on the safe	ety assessment of octyl pa	Ilmitate, cetyl palmitate, and isopropyl palmitate	
Cetyl palmitate	Safe as used (1982; reaffirmed in 2005)	<ul> <li>Was quantitatively excreted in the feces of male rats when fed at 20% in the diet</li> </ul>	8,10
		<ul> <li>Acute oral LD<sub>50</sub> was &gt; 14.4 g/kg in rats; not toxic in a 9-day dietary study in rats</li> <li>No mortality was observed when a 50% slurry was applied to rabbit skin under an occlusive patch</li> <li>Was at most mildly irritating in rabbits when applied undiluted or in formulation (2.5%-2.7%) under occlusion; a 1% suspension produced minimal irritation and was not sensitizing in the Landsteiner and Jacobs test in guinea price</li> </ul>	
		<ul> <li>pigs</li> <li>In humans, a formulation containing 2.7% was not a primary irritant (10 subjects); in maximization studies, a formulation containing 2.5% was classified as a weak potential sensitizer that was unlikely to present a risk of contact sensitization under conditions of normal use (50 subjects) and one containing 2.7% was classified as a weak potential sensitizer of the lowest grade (25 subjects); a formulation containing 2.7% was not phototoxic (10 subjects) or photoallergenic (25 subjects); low irritation potential was observed in in-use studies (28-56 days; 30-100 subjects per study)</li> <li>Minimally irritating to rabbit eyes; Olls ranged from 0.3 to 6.7 for undiluted</li> </ul>	
		test material and 0.0 for a 5% (w/w) dispersion	
Ethylhexyl palmitate (originally, octyl palmitate)	Safe as used (1982; reaffirmed in 2005)	<ul> <li>The acute oral LD<sub>50</sub> was &gt;64 mL/kg in rats</li> <li>The acute dermal LD<sub>50</sub> was &gt;9.4 mL/kg in rabbits (only 2 rabbits in each group); dermal toxicity was not observed in a 6-week dermal study with undiluted material; undiluted test material was "poorly tolerated" in a 60-day study with "congestive dermatitis" in 2/3 rabbits</li> <li>Was a mild irritant tested undiluted in an SIOPT in rabbits; 0.1% suspensions</li> </ul>	8,10
		were not sensitizers in the Landsteiner and Jacobs test in guinea pigs – In human studies, 3 formulations containing 1%-5% and one containing 40%- 50% tested in 48-hour occlusive tests with 100 subjects and 3 formulations containing 45.72%-46.52% tested in an 18-day occlusive RIPT with 20 subjects were not irritants, and in a 21-day occlusive RIPT, a formulations containing 42.25% resulted in signs of irritation in 7/24 subjects and the avg. cumulative irritation score was 2.58/84	
lsopropyl palmitate	Safa as used (1982)	<ul> <li>Olls for undiluted test material ranged from 0.33 to 4.17 in 3 Draize studies, indicating that it did not cause significant injury to rabbit eyes</li> <li>The acute oral LD<sub>50</sub> was &gt;64 mL/kg in rats</li> </ul>	8,10
	reaffirmed in 2005)	<ul> <li>The acute oral LD<sub>50</sub> was &gt;04 mL/kg in rats</li> <li>The dermal LD<sub>50</sub> was &gt;2.0 mL/kg in rabbits</li> <li>No inhalation toxicity in rats exposed to 200 mg/L for 1 hour</li> <li>Undiluted test material was nonirritating to slightly irritating to rabbit skin</li> <li>In human testing, in 3 studies with 24-hour occlusive patches with undiluted test material performed in a total of 160 subjects, there were 5 irritation scores of 0.5/4, and the remainder was 0/4 and in a 10-day primary irritation study, a formulation containing 45.6% was not irritating in 10 subjects; not a sensitizer when tested undiluted in an RIPT with 102 subjects or in formulation at 45.6% in a maximization test with 25 subjects; a formulation containing 45.6% was not phototoxic (10 subjects) or photoallergenic (25 subjects)</li> <li>Olls ranged from 0.0 to 6.5 in 5 Draize studies, indicating that it did not cause significant injury to rabbit eyes</li> </ul>	

Discussion item: safety test data on Ricinus communis (castor) seed oil, which contains ricinoleic acid (and for which data were included), were considered applicable for extrapolation to determine safety; retrospective study reports

Table 2. (continued)
----------------------

Alkyl ester	Conclusion (year)	Summary data	Reference
		of sensitization reactions to ricinoleic acid in patients with eczematous cheilitis were determined to be expected in that patient group but not the general population, and based on the Panel's expertise and experience, the	
Cetyl ricinoleate	Safe as used (2007)	incidence of positive reactions to ricinoleic acid was very low – The acute oral $LD_{50}$ in mice was >2 g/kg	11
lsopropyl	Safe as used (2007)	<ul> <li>Not irritating to rabbit skin (test concentration not stated)</li> <li>No specific safety data were available</li> </ul>	11
ricinoleate Octyldodecyl ricinoleate	Safe as used (2007)	– No specific safety data were available	П
	ety assessment of Cocos n	ucifera (coconut) oil and related ingredients	
		Discussion items: because there is no reason to expect the toxicity to differ from that of coconut oil, coconut acid, hydrogenated coconut oil, and hydrogenated coconut acid and therefore the data available on these ingredients are supportive of safety; necessary procedures should be continued by the cosmetics industry to limit pesticide residues and heavy metals	
Decyl cocoate	Safe as used (2011)	– No data were available	12
Ethylhexyl cocoate	Safe as used (2011)	– No data were available	12
Isodecyl cocoate	Safe as used (2011)	– No data were available	12
Lauryl cocoate	Safe as used (2011)	– No data were available	12
Octyldodecyl cocoate	Safe as used (2011)	– No data were available	12
Tridecyl cocoate	Safe as used (2011)	– No data were available	12
Final report on the saf	ety assessment of decyl ar	nd isodecyl oleates	
Decyl oleate	Safe as used (1982; reaffirmed in 2003)	<ul> <li>The acute oral LD<sub>50</sub> was &gt; 40 mL/kg and &gt;5 g/kg in rats</li> <li>In a primary dermal irritation study using rabbits, the PIIs for a 10% solution in corn oil, 20% solution in mineral oil, and undiluted test material were 0.08, 0.05, and 0.28, respectively, and in a modified Draize test, a 15% solution in polyoxyethylene sorbitan stearate (3%), preservative (2%), and water and undiluted test material were nonirritating; in an 8-week study in rabbits, daily application of the 15% solution produced some papulae or vesicles but was generally well tolerated and the undiluted material resulted in skin thickening in 3 rabbits (total tested not stated) and vesicles in 1 rabbit and was poorly tolerated; a 15% solution in corn oil was not a sensitizer in the Landsteiner and Jacobs test in guinea pigs</li> <li>In human testing, no sensitization was reported in an RIPT in 103 subjects with a formulation containing 1%-5% or in 402 subjects with 4 formulations containing 5.5%</li> <li>At most, a very slight irritant to rabbit eyes when tested undiluted</li> </ul>	13,14
Isodecyl oleate	Safe as used (1982; reaffirmed in 2003)	<ul> <li>The acute LD<sub>50</sub> was &gt; 40 mL/kg in rats</li> <li>Undiluted test material had a PII of 1.0 in 3 rabbits, but subsequent testing reported a PII of 0.28 and additional studies with a 15% solution in polyoxyethylene sorbitan stearate (3%), preservative (2%), and water indicated the material was nonirritating (PII scores of 0.0 and 0.13 for the undiluted material and 0.0 for the 15% solution); in an 8-week study in rabbits, daily application of the 15% solution produced episodical macules, papulae, and vesicles but was relatively well tolerated and the undiluted material was poorly tolerated with congestive dermis effects; a 15% solution in corn oil was not a sensitizer in the Landsteiner and Jacobs test in guinea pigs</li> <li>In humans, undiluted test material was not an irritant in an SIOPT in 19 subjects and in a 21-day cumulative irritancy test in 9 subjects with undiluted material, the irritation score was 1.0/756</li> <li>At most, a very slight irritant to rabbit eyes when tested undiluted</li> </ul>	
	ety assessment of isoprop	-	
lsopropyl isostearate	Safe as used (1992, reaffirmed in 2011)	- Undiluted test material was a nonirritant (PII = 0.42) in rabbit skin 24 and 72 hours after application, and in an 8-week study, a 10% aq solution was relatively well tolerated (IIMM = 2.00) but the undiluted material was poorly	15,16

<b>Table 2.</b> (c	continued)
--------------------	------------

Alkyl ester	Conclusion (year)	Summary data	Reference
		tolerated (IIMM = 3.34) and discontinued after 5 weeks; undiluted test material induced severe comedones in rabbit ears - 10% aq and undiluted test material were slight ocular irritants in rabbit eyes <i>Discussion item</i> : because limited toxicological data (dermal irritation, ocular irritation, and comedogenicity data) were available, the Panel used data on similar isopropyl esters that had already been reviewed and found safe to determine safety	
Final report on the saf	fety assessment of isoprop	- -	
lsopropyl linoleate	Insufficient to support safety (1992)	<ul> <li>The oral LD<sub>50</sub> in rats of 10% in corn oil was &gt;64 cm<sup>3</sup>/kg</li> <li>10% aq and undiluted test material were classified as slightly irritant and nonirritant, respectively, in primary irritation studies in rabbits; both 10% aq and undiluted test materials were slight irritants when the study was repeated with purer samples; in another primary skin irritation study, 10% in corn oil did not product any irritation reactions in albino rabbits</li> <li>10% aq and undiluted test material were slight ocular irritants, while 10% in corn oil was not irritating to rabbit eyes</li> <li>Discussion item: human irritation and sensitization data and genotoxicity data were needed</li> </ul>	20
Final report on the saf	fety assessment of isostear		
Isostearyl neopentanoate	Safe as used (1985, reaffirmed in 2006)	<ul> <li>The acute oral LD<sub>50</sub> was &gt;40 mL/kg in rats; in a 93 day study, oral administration of undiluted test material in rats was safe in terms of cumulative systemic toxicity</li> <li>Undiluted test material applied under a 24-hour patch was not irritating to rabbit skin and formulations containing 1.2%-32% was a most mildly irritating in rabbits; not considered a sensitizer in a GPMT (observations were attributed to scratches) and not a sensitizer in the Landsteiner and Jacobs test in guinea pigs; a formulation containing 3% was a mild primary skin irritant but was not phototoxic; 50% in mineral oil was marginally comedogenic and undiluted was noncomedogenic in rabbit ears</li> <li>In human testing, was nonirritating in a 48-hour SIOPT when tested undiluted or in formulations containing 3%-5% (10 or 100 subjects), 4% in formulation (20 subjects) was minimally irritating (PII = 0.08) and 1.2% in formulation was nonirritating in a 21-day study (15 subjects); undiluted test material and formulations containing 5%-32% were not sensitizers in RIPT studies (52-210 subjects per study), although some irritation was reported; a formulation containing 16.05% was not phototoxic or a photoallergen in 27 subjects</li> <li>Undiluted test material was minimally irritating in rabbit eyes and formulations containing 1.2%-36% were at most minimally irritating</li> <li>Discussion items: because of the skin penetration enhancement property of pelargonic acid in the presence of <i>p</i>-aminobenzoic acid, care should be taken in formulating products containing this ingredient in combination with any ingredients whose safety was based on lack of dermal absorption or when dermal absorption was a concern</li> </ul>	17,21
	l heptanoate and related st fety assessment of stearyl l	tearyl alkanoates as used in cosmetics heptanoate	
Stearyl behenate Stearyl caprylate Stearyl heptanoate	Safe as used (2010) Safe as used (2010) Safe as used (1995, reaffirmed 2010)	<ul> <li>Discussion items: data from the original review on stearyl heptanoate were applicable to determine safety, including extrapolated data on stearyl alcohol and heptanoic acid</li> <li>No data were available</li> <li>No data were available</li> <li>The oral LD<sub>50</sub> in rats was &gt;16 mL/kg</li> <li>A mixture that also contained stearyl caprylate was not mutagenic in an Ames test with or without metabolic activation and had no clastogenic effect in an in vivo micronucleus test in which mice were given a single oral dose of 500-1500 mg/kg in corn oil</li> </ul>	18 18 18,19

Alkyl ester	Conclusion (year)	Summary data	Reference
		<ul> <li>Undiluted test material was mildly irritating to rabbit skin (PII = 1.21/8); a formulation containing 1.5% was not a sensitizer in guinea pigs; a formulation containing 1.5% produced slight to moderate comedogenicity in rabbit ears</li> <li>In human testing, cosmetic formulations containing 0.7% (198 subjects) and 1.5% (156, 194, and 202 subjects) were not sensitizers in RIPTs</li> <li>Undiluted test material was a category 3 ocular irritant in rabbit eyes and a formulation containing 1.5% was not a primary ocular irritant</li> <li><i>Discussion items</i>: although irritation testing was performed at 100%, sensitization testing was only performed with a maximum concentration of 1.5%; however, there was no indication that this ingredient would be a sensitizer; mild reactions were observed in ocular irritation studies with undiluted material and no irritation with a formulation containing 1.5%, therefore the Panel was of the opinion that in formulation, this ingredient would not produce significant ocular irritation; because there was limited information available, data on stearyl alcohol and heptanoic acid were extrapolated to determine safety</li> </ul>	
Stearyl olivate	Safe as used (2010)	– No data were available	18
Stearyl palmitate	Safe as used (2010)	– No data were available	18
Stearyl stearate	Safe as used (2010)	– No data were available	18

Abbreviations: GPMT, guinea pig maximization test; IIMM, maximum irritation index; LD<sub>50</sub>, median lethal dose; OII,ocular irritation index; PII, primary irritation index; RIPT, repeated insult patch test; SIOPT, single insult occlusive patch test; avg, average; aq, aqueous.

Abbreviation: CIR, Cosmetic Ingredient Review. <sup>a</sup>Grouped by whether individual constituents have been reviewed.

<sup>b</sup>Isopropyl linoleate was reviewed previously by the CIR, with a conclusion of insufficient data to support safety. <sup>c</sup>The acid component is a mixture of fatty acids, containing predominantly palmitic and stearic acids, both of which have been reviewed.

Constituent	Conclusion (year issued; maximum use concentration reported)	Reference
Alcohols		
Batyl alcohol	Safe as used (2011; 3% in leave-ons, 1% in rinse-offs)	23
Behenyl alcohol	Safe as used (1988; reaffirmed 2008; 50% in leave-ons; 10% in rinse-offs)	4,24
Butyl alcohol	Safe as used (2008; 15% in leave-ons; <0.1% in rinse-offs)	25
Cetearyl alcohol	Safe as used (1988; reaffirmed 2008; 25% in leave-ons; 25% in rinse-off)	4,24
Cetyl alcohol	Safe as used (1988; reaffirmed 2008; 50% in leave-ons; 25% in rinse-offs)	4,24
Cetyl glycol (hydroxycetyl alcohol)	Safe as used (2011; no reported use)	26
Chimyl alcohol	Safe as used (2011; 0.5% in leave-ons, 0.002% in rinse-offs)	23
Coconut alcohol	Safe as used (2011; 0.9% in leave-ons; 0.8% in rinse-offs)	12
Isopropyl alcohol	Safe as used (2012; 100% in leave-ons; 35% in rinse-offs)	27
Isostearyl alcohol	Safe as used (1988; reaffirmed 2008; 50% in leave-ons; 5% in rinse-offs)	4,24

# Table 4. (continued)

Constituent	Conclusion (year issued; maximum use concentration reported)	Reference
lojoba alcohol	Safe as used (2008; 1% in leave-ons; 0.5% in rinse-offs)	28
Myristyl alcohol	Safe as used (1988; reaffirmed 2008; 12% in leave-ons; 7% in rinse-offs)	4,24
Octyldodecanol	Safe as used (1985, reaffirmed 2006; 85% in leave-ons; 30% in rinse-offs)	17,29
Oleyl alcohol	Safe as used (1985; reaffirmed 2006; >50% in leave-ons; 25% in rinse-offs)	17,29
Stearyl alcohol	Safe as used (1985; reaffirmed 2006; 56% in leave-ons; 25% in rinse-offs)	17,29
Acids		
Adipic acid	Safe as used (2012; 0.000001% in leave-on; 18% in rinse-off)	30
Babassu acid	Safe as used (2011; no reported use)	31
Coconut acid	Safe as used (2011; not reported in leave-ons; 14% in rinse-offs)	12,31
Hydroxystearic acid	Safe as used (1999; 10% in leave-ons; not reported for rinse-offs)	32
Isostearic acid	Safe as used (1983; reaffirmed in 2005; 16% in leave-ons, 26% in rinse-offs)	8,33
Lauric acid	Safe as used (1987; reaffirmed in 2006; 10% in leave-ons, 25% in rinse-offs)	17,34
Myristic acid	Safe as used (2010; 15% in leave-ons; 50% in rinse-offs)	5
Óleic acid	Safe as used (1987; reaffirmed in 2006; 25% in leave-ons; 50% in rinse-offs)	17,34
Olive acid	Safe as used (2011; no reported use)	31
Palm acid	Safe as used (2011; not reported in leave-ons; 17% in rinse-offs)	31
Palmitic acid	Safe as used (1987; reaffirmed in 2006; 25% in leave-ons, 25% in rinse-offs)	17,34
Pelargonic acid	Safe as used (2011; no reported use)	9
Rice bran acid	Safe as used (2011; no reported use)	31
Ricinoleic acid	Safe as used (2007; use concentration not reported)	11
Safflower acid	Safe as used (2011; no reported use)	31
Stearic acid	Safe as used (1987; reaffirmed in 2006; >50% in leave-ons; 50% in rinse-offs)	17,34
Tall oil acid	Safe as used (2009; not reported in leave-ons; 8% in rinse-offs)	35

Abbreviation: CIR, Cosmetic Ingredient Review.

Ingredient/CAS no.	Definition (italicized text generated by CIR)	Function
Arachidyl behenate/42233-14-7	The ester of arachidyl alcohol and behenic acid. The ester obtained from the reaction of arachidyl alcohol with behenic acid.	Skin-cond agent—oc; visc incr agent—nonaq
Arachidyl erucate/86601-86-7	The ester of arachidyl alcohol and erucic acid. The ester obtained from the reaction of arachidyl alcohol with erucic acid.	Skin-cond agent—emol
Arachidyl propionate/65591-14-2	The ester of arachidyl alcohol and n-propionic acid. The ester obtained from the reaction of arachidyl alcohol and n- propionic acid.	Skin-cond agent—emol
Batyl isostearate/170754-20-8	An ester of batyl alcohol and isostearic acid. The mixture of esters obtained from the reaction of batyl alcohol with branched-chain stearic acids.	Skin-cond agent—oc
Batyl stearate/13232-26-3	An ester of batyl alcohol and stearic acid. The ester obtained from the reaction of batyl alcohol with stearic acid.	Skin-cond agent—oc
Behenyl beeswax	The ester of behenyl alcohol and beeswax acid. The mixture of esters obtained from the reaction of behenyl alcohol with a mixture of straight-chain fatty acids, containing 24 to 36 carbons in alkyl chain length (beeswax acid).	Skin-cond agent—oc
Behenyl behenate/17671-27-1	The ester of behenic acid and behenyl alcohol. The ester obtained from the reaction of behenic acid with behenyl alcohol.	Skin-cond agent—oc
Behenyl erucate/18312-32-8	The ester of behenyl alcohol and erucic acid. The ester obtained from the reaction of behenyl alcohol with erucic acid.	Skin-cond agent—oc

 Table 5. Definitions and Functions.

Table 5. (continued)

Ingredient/CAS no.	Definition (italicized text generated by CIR)	Function
Behenyl isostearate/181496-25-3	The ester of behenyl alcohol and isostearic acid that conforms to the formula. The mixture of esters obtained from the reaction of behenyl alcohol with branched-chain stearic acids.	Skin-cond agent—oc
Behenyl/isostearyl beeswax	The ester of a mixture of behenyl alcohol and isostearyl alcohol with beeswax acid. The mixture of esters obtained from the reaction of behenyl alcohol and branched-chain stearyl alcohols with a mixture of straight- chain fatty acids, containing 24 to 36 carbons in alkyl chain length (beeswax acid).	Skin-cond agent—oc
Behenyl olivate	The ester of behenyl alcohol and olive acid that conforms generally to the formula. The mixture of esters obtained from the reaction of behenyl alcohol with the fatty acids derived from olive acid.	Skin-cond agent—misc; emul stabilizer; film former; slip modifier; visc incr agent—nonaq
Butyl avocadate	The ester of butyl alcohol and the fatty acids derived from Persea gratissima (avocado) oil. The mixture of esters obtained from the reaction of butyl alcohol with the fatty acids derived from Persea gratissima (avocado) oil.	Skin-cond agent—misc
Butyl babassuate	The ester of butyl alcohol and the fatty acids derived from babassu oil. The mixture of esters obtained from the reaction of butyl alcohol with the fatty acids derived from babassu oil.	Disp agent—nonsurf; emul stab; skin- cond, agent—emol; surf—solub agent
Butyl isostearate	The ester of butyl alcohol and isostearic acid that conforms to the formula. The mixture of esters obtained from the reaction of butyl alcohol with branched-chain stearic acids.	Skin-cond, agent—emol
Butyl myristate/110-36-1	The ester of butyl alcohol and myristic acid. The ester obtained from the reaction of butyl alcohol with myristic acid.	Skin-cond, agent—emol
Butyl oleate/142-77-8	The ester of butyl alcohol and oleic acid. The ester obtained from the reaction of butyl alcohol with oleic acid.	Skin-cond, agent—emol; fragrance ingr
Butyl stearate/123-95-5	The ester of butyl alcohol and stearic acid. The ester obtained from the reaction of butyl alcohol and stearic acid.	Skin-cond, agent—emol; fragrance ingr
Butyloctyl beeswax/151661-98-2	The ester of butyloctanol and beeswax acid. The mixture of esters obtained from the reaction of 2-butyloctanol with a mixture of straight-chain fatty acids, containing 24 to 36 carbons in alkyl chain length (beeswax acid).	Skin-cond agent—oc
Butyloctyl behenate	The organic compound that conforms to the formula. The ester obtained from the reaction of 2-butyloctanol with behenic acid.	Skin-cond agent—emol
Butyloctyl candelillate/226994-03-2	The ester of 2-butyloctanol and the acids derived from Euphorbia cerifera (candelilla) wax. The mixture of esters obtained from the reaction of 2-butyloctanol with the fatty acids derived from Euphorbia cerifera (candelilla) wax.	Skin-cond agent—oc
Butyloctyl cetearate/101227-08-1	The ester of butyloctanol and a blend of fatty acids containing predominantly palmitic and stearic acid. The mixture of esters obtained from the reaction of 2- butyloctanol with a mixture of fatty acids containing predominately palmitic acid and stearic acid.	Skin-cond agent—emol
Butyloctyl oleate	The ester of butyloctanol and oleic acid. The ester obtained from the reaction of 2 butyloctanol with oleic acid.	Skin-cond agent—oc
Butyloctyl palmitate	The ester of butyloctanol and palmitic acid. The ester obtained from the reaction of 2-butyloctanol with palmitic acid.	Skin-cond agent—emol
C14-30 alkyl beeswax/209225-40-1	The ester of a mixture of fatty alcohols containing 14 to 30 carbons in the alkyl chain with beeswax acid. The mixture of esters obtained from the reaction of a mixture	Skin-cond agent—oc

Table 5. (continued)

Ingredient/CAS no.	Definition (italicized text generated by CIR)	Function
C18-38 alkyl beeswax/223706-17-0	of fatty alcohols, containing 14 to 30 carbons in the alkyl chain, with a mixture of straight-chain fatty acids, containing 24 to 36 carbons in alkyl chain (beeswax acid). The ester of a mixture of fatty alcohols containing 18 to 38 carbon atoms in the alkyl chain and beeswax acid. The mixture of esters obtained from the reaction of a mixture of fatty alcohols, containing 18 to 38 carbons in the alkyl chain, with a mixture of straight-chain fatty acids,	Skin-cond agent—oc
C30-50 alkyl beeswax/223707-19-5	containing 24 to 36 carbons in alkyl chain (beeswax acid). The ester of C30-50 alcohols and beeswax acid. The mixture of esters obtained from the reaction of a mixture of fatty alcohols, containing 30 to 50 carbons in the alkyl chain, with a mixture of straight-chain fatty acids, containing 24 to 36 carbons in alkyl chain (beeswax acid).	Skin-cond agent—oc
C20-40 alkyl behenate	The ester of C20-40 alcohols and behenic acid. The mixture of esters obtained from the reaction of a mixture of fatty alcohols, containing 20 to 40 carbons in the alkyl chain, with behenic acid.	Skin-cond agent—oc
C18-38 alkyl C24-54 acid ester	The ester of a mixture of fatty alcohols containing 18 to 38 carbon atoms and a mixture of fatty acids containing 24 to 54 carbon atoms. The mixture of esters obtained from the reaction of a mixture of fatty alcohols, containing 30 to 50 carbons in the alkyl chain, with a mixture of straight-chain fatty acids, containing 24 to 54 carbons in alkyl chain.	Visc incr agent—nonaq
C16-36 alkyl stearate	The ester of C16-36 alcohols and stearic acid. The mixture of esters obtained from the reaction of a mixture of fatty alcohols, containing 16 to 36 carbons in the alkyl chain, with stearic acid.	Skin-cond agent—oc
C20-40 alkyl stearate	The ester of C20-40 alcohols and stearic acid. The mixture of esters obtained from the reaction of a mixture of fatty alcohols, containing 20 to 40 carbons in the alkyl chain, with stearic acid.	Skin-cond agent—oc; visc incr agent—aq
C30-50 alkyl stearate	The ester of C30-50 alcohols and stearic acid. The mixture of esters obtained from the reaction of a mixture of fatty alcohols, containing 30 to 50 carbons in the alkyl chain, with stearic acid.	Skin-cond agent—oc
C40-60 alkyl stearate	The ester of C40-60 alcohols and stearic acid. The mixture of esters obtained from the reaction of a mixture of fatty alcohols, containing 40 to 60 carbons in the alkyl chain, with stearic acid.	Skin-cond agent—oc
Caprylyl butyrate/110-39-4	The ester of n-octanol with butyric acid that conforms to the formula. The ester obtained from the reaction of n- octanol with butyric acid.	Skin-cond agent—misc; fragrance ingredient
Caprylyl caprylate/2306-88-9	The organic compound that conforms to the formula. The ester obtained from the reaction of n-octanol with n- octanoic acid.	Skin-cond agent—emol
Caprylyl eicosenoate	The organic compound that conforms to the formula. The ester obtained from the reaction of n-octanol with 11- eicosenoic acid.	Skin-cond agent—misc
Cetearyl behenate	The ester of cetearyl alcohol and behenic acid. The mixture of esters obtained from the reaction of a mixture of fatty alcohols, containing 16 to 18 carbons in the alkyl chain, with behenic acid.	Skin-cond agent—oc
Cetearyl candelillate	The ester of cetearyl alcohol and the fatty acids derived from Euphorbia cerifera (candelilla) wax. The mixture of esters obtained from the reaction of a mixture of fatty alcohols, containing 16 to 18 carbons in the alkyl chain, with the fatty acids derived from Euphorbia cerifera (Candelilla) Wax.	

Table 5. (continued)

Ingredient/CAS no.	Definition (italicized text generated by CIR)	Function
Cetearyl isononanoate	The ester of cetearyl alcohol and a branched chain nonanoic acid. The mixture of esters obtained from the reaction of a mixture of fatty alcohols, containing 16 to 18 carbons in the alkyl chain, with branched chain nonanoic acid.	Skin-cond agent—emol; hair-cond agent
Cetearyl nonanoate/878027-13-5	The organic compound that conforms to the formula. The mixture of esters obtained from the reaction of a mixture of fatty alcohols, containing 16 to 18 carbons in the alkyl chain, with nonanoic acid.	Skin-cond agent—emol
Cetearyl olivate	The ester of cetearyl alcohol and the fatty acids derived from olive oil. The mixture of esters obtained from the reaction of a mixture of fatty alcohols, containing 16-18 carbons in the alkyl chain, with the fatty acids derived from olive oil.	Hair-cond agent
Cetearyl palmate	The ester of cetearyl alcohol and palm acid. The mixture of esters obtained from the reaction of a mixture of fatty alcohols, containing 16 to 18 carbons in the alkyl chain, with the fatty acids derived from palm acid.	Skin-cond agent—emol; emul stab
Cetearyl palmitate/85341-79-3	The ester of cetearyl alcohol and palmitic acid. The mixture of esters obtained from the reaction of a mixture of fatty alcohols, containing 16 to 18 carbons in the alkyl chain, with palmitic acid.	Skin-cond agent—emol; hair-cond agent
Cetearyl rice branate	The ester of cetearyl alcohol and rice bran acid. The mixture of esters obtained from the reaction of a mixture of fatty alcohols, containing 16 to 18 carbons in the alkyl chain, with the fatty acids derived from rice bran acid.	Skin-cond agent—misc
Cetearyl stearate/93820-97-4	The ester of cetearyl alcohol and stearic acid. The mixture of esters obtained from the reaction of a mixture of fatty alcohols, containing 16 to 18 carbons in the alkyl chain, with stearic acid.	Skin-cond agent—oc
Cetyl babassuate/613236-40-1	The ester of cetyl alcohol and the fatty acids derived from Orbignya oleifera (babassu) oil. The mixture of esters obtained from the reaction of cetyl alcohol with the fatty acids derived from Orbignya oleifera (babassu) oil.	Skin-cond agent—emol; visc incr agent—aq
Cetyl behenate/42233-11-4	The ester of that conforms to the formula. The ester obtained from the reaction of cetyl alcohol with behenic acid.	Skin-cond agent—oc
Cetyl caprate	The ester of cetyl alcohol and capric acid. The ester obtained from the reaction of cetyl alcohol with capric acid.	Skin-cond agent—emol
Cetyl caprylate/29710-31-4	The ester of cetyl alcohol and caprylic acid. The ester obtained from the reaction of cetyl alcohol with caprylic acid.	Skin-cond agent—emol
Cetyl dimethyloctanoate	The ester of cetyl alcohol and dimethyloctanoic acid. The ester obtained from the reaction of cetyl alcohol with dimethyloctanoic acid.	Skin-cond agent—emol
Cetyl esters	A synthetic wax intended to be indistinguishable from natural spermaceti wax with regard to composition and properties. It consists of a mixture of esters of 14 to 18 carbon fatty acids and alcohols. The mixture of esters obtained from the reaction of a mixture of fatty alcohols, containing 14 to 18 carbons in the alkyl chain, with a mixture of straight-chain fatty acids, containing 14 to 18 carbons in the alkyl chain.	Skin-cond agent– emol
Cetyl isononanoate/84878-33-1	The ester of cetyl alcohol with a branched chain nonanoic acid. The mixture of esters obtained from the reaction of cetyl alcohol with branched-chain nonanoic acids.	Skin-cond agent—emol

Table 5. (continued)

Ingredient/CAS no.	Definition (italicized text generated by CIR)	Function
Cetyl laurate/20834-06-4	The ester of cetyl alcohol and lauric acid that conforms to the formula. The ester obtained from the reaction of cetyl alcohol with lauric acid.	Skin-cond agent—emol
Cetyl myristate/2599-01-1	The ester of cetyl alcohol and myristic acid. The ester obtained from the reaction of cetyl alcohol and myristic acid.	Skin-cond agent—oc
Cetyl myristoleate	The ester of cetyl alcohol and myristoleic acid that conforms to the formula. The ester obtained from the reaction of cetyl alcohol and myristoleic acid.	Skin-cond agent—misc
Cetyl oleate/22393-86-8	The ester of cetyl alcohol and oleic acid. The ester obtained from the reaction of cetyl alcohol with oleic acid.	Skin-cond agent—emol
Cetyl palmitate/540-10-3	The ester of cetyl alcohol and palmitic acid. The ester obtained from the reaction of cetyl alcohol with palmitic acid.	Skin-cond, agent—oc; fragrance ingr
Cetyl ricinoleate/10401-55-5	The ester of cetyl alcohol and ricinoleic acid. The ester obtained from the reaction of cetyl alcohol with ricinoleic acid.	Skin-cond agent—oc
Cetyl stearate/1190-63-2	The ester of cetyl alcohol and stearic acid. The ester obtained from the reaction of cetyl alcohol with stearic acid.	Skin-cond agent—oc
Cetyl tallowate	The ester of cetyl alcohol and tallow acid. The mixture of esters obtained from the reaction of cetyl alcohol with the fatty acids derived from tallow acid.	Skin-cond agent—misc
Chimyl isostearate	The ester of chimyl alcohol and isostearic acid. The mixture of esters obtained from the reaction of cetyl glyceryl ether with branched-chain stearic acids.	Skin-cond agent—emol
Chimyl stearate/131932-18-8	The ester of chimyl alcohol and stearic acid. The ester obtained from the reaction of cetyl glyceryl ether with stearic acid.	Skin-cond agent—emol
C10-40 isoalkyl acid octyldodecanol esters	A mixture of esters of octyldodecanol with branched- chain alkyl acids containing 10 to 40 carbons. The mixture of esters obtained from the reaction of 2- octyldodecanol with branched-chain fatty acids, containing 10 to 40 carbons in the alkyl chain.	Skin-cond agent—misc; visc incr agent—nonaq
C4-5 isoalkyl cocoate	The ester of a branched, saturated fatty alcohol containing 4 to 5 carbons, with coconut acid. The mixture of esters obtained from the reaction of branched- chain alcohols, containing 4 to 5 carbons, with the fatty acids derived from coconut acid.	Skin-cond agent—emol
C32-36 isoalkyl stearate/68201-22-9	The ester of a branched, saturated fatty alcohol containing 32 to 36 carbons, with stearic acid. The mixture of esters obtained from the reaction of branched-chain alcohols, containing 32 to 36 carbons, with stearic acid.	Skin-cond agent—emol
Coco-caprylate	The organic compound that conforms to the formula. The mixture of esters obtained from the reaction of the fatty alcohols derived from coconut alcohol with caprylic acid.	Skin-cond agent—emol
Coco-caprylate/caprate	A mixture of esters of coconut alcohol with caprylic acid and capric acid. The mixture of esters obtained from the reaction of the fatty alcohols derived from coconut alcohol with a mixture of caprylic acid and capric acid.	Skin-cond agent—emol
Coco-rapeseedate	The ester of coconut alcohol and the fatty acids derived from Brassica campestris (rapeseed) oil. The mixture of esters obtained from the reaction of the fatty alcohols derived from coconut alcohol with the fatty acids derived from Brassica campestris (rapeseed) oil.	

Table 5. (continued)

Ingredient/CAS no.	Definition (italicized text generated by CIR)	Function
Decyl castorate	The ester of decyl alcohol and the fatty acids derived from Ricinus communis (castor) oil. The mixture of esters obtained from the reaction of decyl alcohol with the fatty acids derived from ricinus communis (castor) oil.	Skin-cond agent—emol; emul stab
Decyl cocoate	The ester of decyl alcohol and the fatty acids derived from Cocos nucifera (coconut) oil. The mixture of esters obtained from the reaction of decyl alcohol with the fatty acids derived from Cocos nucifera (coconut) oil.	Skin-cond agent—oc
Decyl isostearate/84605-08-3	The ester of decyl alcohol and isostearic acid. The mixture of esters obtained from the reaction of decyl alcohol with branched-chain stearic acids.	Skin-cond agent—emol
Decyl jojobate	The ester of decyl alcohol and the fatty acids derived from Simmondsia chinensis (jojoba) oil. The mixture of esters obtained from the reaction of decyl alcohol with the fatty acids derived from Simmondsia chinensis (jojoba) oil.	Skin-cond agent—emol
Decyl laurate/36528-28-6	The organic compound that conforms to the formula. The ester obtained from the reaction of decyl alcohol with lauric acid.	Skin-cond agent—emol
Decyl myristate/41927-71-3	The ester of decyl alcohol and myristic acid that conforms to the formula. The ester obtained from the reaction of decyl alcohol with myristic acid.	Skin-cond agent—oc
Decyl oleate/3687-46-5	The ester of decyl alcohol and oleic acid. The ester obtained from the reaction of decyl alcohol with oleic acid.	Skin-cond agent—emol
Decyl olivate	The ester of decyl alcohol and the fatty acids derived from Olea europaea (olive) oil. The mixture of esters obtained from the reaction of decyl alcohol with the fatty acids derived from Olea europaea (olive) oil.	Skin-cond agent—oc
Decyl palmitate/42232-27-9	The ester of decyl alcohol and palmitic acid that conforms to the formula. The ester obtained from the reaction of decyl alcohol with palmitic acid.	Skin-cond agent—emol
Decyltetradecyl cetearate/97404-34-7	The ester of decyltetradecanol and a blend of fatty acids containing predominantly palmitic and stearic acid. The mixture of esters obtained from the reaction of 2 decyltetradecanol with a mixture of fatty acids, containing predominantly palmitic acid and stearic acid.	Skin-cond agent—emol
Ethylhexyl adipate/palmitate/stearate	A mixture of esters formed by the reaction of 2- ethylhexyl alcohol with adipic, palmitic, and stearic acids.	Skin-cond agent—emol
Ethylhexyl C10-40 isoalkyl acidate	The ester of C10-40 isoalkyl acid and 2-ethylhexyl alcohol. The mixture of esters obtained from the reaction of 2 ethylhexyl alcohol with branched-chain acids, containing 10 to 40 carbons in the alkyl chain.	Skin-cond agent—misc; visc incr agent—nonaq
Ethylhexyl cocoate/91052-62-9;92044-87-6	The ester of 2-ethylhexanol and coconut acid that conforms to the formula. The mixture of esters obtained from the reaction of 2 ethylhexyl alcohol with the fatty acids derived from coconut acid.	Skin-cond agent—emol
Ethylhexyl hydroxystearate/29383-26-4; 29710-25-6	The ester of 2-ethylhexyl alcohol and 12-hydroxystearic acid. The ester obtained from the reaction of 2-ethylhexyl alcohol with 12 hydroxystearic acid.	Skin-cond agent—emol
Ethylhexyl isononanoate/70969-70-9; 71566-49-9	The ester of 2-ethylhexyl alcohol and a branched chain nonanoic acid. The mixture of esters obtained from the reaction of 2 ethylhexyl alcohol with branched-chain nonanoic acids.	Skin-cond agent—emol
Ethylhexyl isopalmitate/93843-32-4	The ester of 2-ethylhexanol and a branched chain 16 carbon aliphatic acid. The mixture of esters obtained from the reaction of 2-ethylhexanol with branched-chain palmitic acids.	Skin-cond agent—emol

Table 5. (continued)

Ingredient/CAS no.	Definition (italicized text generated by CIR)	Function
Ethylhexyl isostearate/81897-25-8; 85186- 76-1	The ester of 2-ethylhexyl alcohol and isostearic acid. The mixture of esters obtained from the reaction of 2- ethylhexyl alcohol with branched-chain stearic acids.	Skin-cond agent—emol
Ethylhexyl laurate/20292-08-4	The ester of 2-ethylhexyl alcohol and lauric acid. The ester obtained from the reaction of 2-ethylhexyl alcohol with lauric acid.	Skin-cond agent—emol
Ethylhexyl myristate/29806-75-5	The ester of 2-ethylhexyl alcohol and myristic acid. The ester obtained from the reaction of 2-ethylhexyl alcohol with myristic acid.	Skin-cond agent—emol
Ethylhexyl neopentanoate	Ester of 2-ethylhexanol and neopentanoic acid. The ester obtained from the reaction of 2-ethylhexanol with neopentanoic acid.	Skin-cond agent—emol
Ethylhexyl oleate/26399-02-0	The ester of oleic acid and 2-ethyl hexyl alcohol. The ester obtained from the reaction of 2-ethylhexyl alcohol with oleic acid.	Skin-cond agent—emol
Ethylhexyl olivate	The ester of ethylhexyl alcohol and the fatty acids derived from Olea europaea (olive) oil. The mixture of esters obtained from the reaction of 2-ethylhexyl alcohol with the fatty acids derived from Olea europaea (olive) oil.	Skin-cond agent—oc
Ethylhexyl palmitate/29806-73-3	The ester of 2-ethylhexyl alcohol and palmitic acid. The ester obtained from the reaction of 2-ethylhexyl alcohol with palmitic acid.	Skin-cond agent—emol; fragrance ingr
Ethylhexyl pelargonate/59587-44-9	The ester of 2-ethylhexyl alcohol and pelargonic acid. The ester obtained from the reaction of 2-ethylhexyl alcohol with pelargonic acid.	Skin-cond agent—emol
Ethylhexyl stearate/22047-49-0	The ester of 2-ethylhexyl alcohol and stearic acid. The ester obtained from the reaction of 2-ethylhexyl alcohol with stearic acid.	Skin-cond agent—emol
Erucyl arachidate	The ester of erucyl alcohol and arachidic acid. The ester obtained from the reaction of erucyl alcohol with arachidic acid.	Skin-cond agent—misc
Erucyl erucate/27640-89-7; 84605-12-9	The ester of erucyl alcohol and erucic acid. The ester obtained from the reaction of erucyl alcohol with erucic acid.	Skin-cond agent—misc
Erucyl oleate/85617-81-8	The ester of erucyl alcohol and oleic acid that conforms to the formula. The ester obtained from the reaction of erucyl alcohol with oleic acid.	Skin-cond agent—misc
Heptyl undecylenate/68141-27-5	The organic compound that conforms to the formula. The ester obtained from the reaction of heptyl alcohol with 10-undecenoic acid.	Skin-cond agent—emol
Heptylundecyl hydroxystearate/ 74659-69-1	The organic compound that conforms to the formula. The ester obtained from the reaction of 2-heptylundecyl alcohol with 12-hydroxystearate.	Skin-cond agent—emol
Hexyldecyl hexyldecanoate	The ester that conforms to the formula. The ester obtained from the reaction of 2 hexyldecanol with 2 hexyldecanoic acid.	Skin-cond agent—emol
Hexyldecyl isostearate/69247-84-3	The ester of hexyldecyl alcohol and isostearic acid. The mixture of esters obtained from the reaction of 2-hexyldecyl alcohol with branched-chain stearic acids.	Skin-cond agent—oc
Hexyldecyl laurate/34362-27-1; 227450-65-9	The ester of hexyldecanol and lauric acid. The ester obtained from the reaction of 2 hexyldecanol with lauric acid.	Skin-cond agent—emol; skin-cond agent—oc
Hexyldecyl oleate/94278-07-6	The ester of hexyldecanol and oleic acid. The ester obtained from the reaction of 2 hexyldecanol with oleic acid.	Skin-cond agent—oc
Hexyldecyl palmitate/69275-02-1	The ester of hexyldecanol and palmitic acid that conforms to the formula. The ester obtained from the reaction of 2-hexyldecanol with palmitic acid.	Skin-cond agent—oc

Table 5. (continued)

Ingredient/CAS no.	Definition (italicized text generated by CIR)	Function
Hexyldecyl stearate/17618-45-0	The ester of stearic acid and hexyldecanol. The ester obtained from the reaction of 2 hexyldecanol with stearic acid.	Skin-cond agent—emol; skin-cond agent—oc
Hexyldodecyl/octyldecyl hydroxystearate	The product formed by the reaction of hexyldodecanol and octyldecanol with hydroxystearic acid. The mixture of esters obtained from the reaction of a mixture of 2 hexyldodecanol and 2-octyldecanol with 12- hydroxystearic acid.	skin-cond agent—emol
Hexyl isostearate/94247-25-3	The ester of hexyl alcohol and isostearic acid that conforms to the formula. The mixture of esters obtained from the reaction of hexyl alcohol with branched-chain stearic acids.	Skin-cond agent—emol
hexyl laurate/34316-64-8	The ester of hexyl alcohol and lauric acid. The ester obtained from the reaction of hexyl alcohol with lauric acid.	Skin-cond agent—emol
Hydrogenated castor oil behenyl esters	The hydrogenation product of the esters formed by the reaction of castor oil and behenyl alcohol. The hydrogenation product of the mixture of esters obtained from the reaction of behenyl alcohol with castor oil.	Hair-cond agent; binder; emul stab
Hydrogenated castor oil cetyl esters	The hydrogenation product of the esters formed by the reaction of castor oil with cetyl alcohol. The hydrogenation product of the mixture of esters obtained from the reaction of cetyl alcohol with castor oil.	Skin-cond agent—misc; hair-cond agent; binder; emul stab
Hydrogenated castor oil stearyl esters	The hydrogenation product of the esters formed by the reaction of castor oil and stearyl alcohol. The hydrogenation product of the mixture of esters obtained from the reaction of stearyl alcohol with castor oil.	Skin-cond agent—misc; hair-cond agent; binder; emul stab
Hydrogenated ethylhexyl olivate	A mixture of esters produced by the reaction of ethylhexanol and hydrogenated olive oil. The mixture of esters obtained from the reaction of 2 ethylhexyl alcohol with hydrogenated olive oil.	Skin-cond agent—emol
Hydrogenated ethylhexyl sesamate	The product of the transesterification of 2-ethylhexyl alcohol and sesame seed oil that has been hydrogenated. The mixture of esters obtained from the reaction of 2 ethylhexyl alcohol with hydrogenated sesame seed oil.	Skin-cond agent—emol; binder
Hydrogenated isocetyl olivate	The end-product of the controlled hydrogenation of the mixture of esters formed by the reaction of isocetyl alcohol with olive acid. The hydrogenation product of the mixture of esters obtained from the reaction of branched- chain cetyl alcohols with the fatty acids derived from olive acid.	Skin-cond agent—misc; binder; disp agent; humectant
Hydrogenated isopropyl jojobate	The end-product of the controlled hydrogenation of isopropyl jojobate. The hydrogenation product of the mixture of esters obtained from the reaction of isopropyl alcohol with the fatty acids derived from Simmondsia chinensis (jojoba) oil.	Skin-cond agent—oc
Hydroxycetyl isostearate	The ester of hydroxycetyl alcohol and isostearic acid. The mixture of esters obtained from the reaction of cetyl glycol with branched-chain stearic acids.	Skin-cond agent—emol
Hydroxyoctacosanyl hydroxystearate/ 93840-71-2	The ester of hydroxyoctacosanyl alcohol and hydroxystearic acid. The ester obtained from the reaction of 2 hydroxyoctacosanyl alcohol with 12- hydroxystearic acid.	Skin-cond agent—emol; visc incr agent
lsoamyl laurate/6309-51-9	The ester of isoamyl alcohol and lauric acid. The ester obtained from the reaction of isoamyl alcohol with lauric acid.	Skin-cond agent—emol; fragrance ingr
lsobutyl myristate/25263-97-2	The ester of isobutyl alcohol and myristic acid. The ester obtained from the reaction of isobutyl alcohol with myristic acid.	Skin-cond agent—emol

Table 5. (continued)

Ingredient/CAS no.	Definition (italicized text generated by CIR)	Function
Isobutyl palmitate/110-34-9	The ester of isobutyl alcohol and palmitic acid. The ester obtained from the reaction of isobutyl alcohol with palmitic acid.	Skin-cond agent—emol; fragrance ingr
lsobutyl pelargonate/30982-03-7	The ester of isobutyl alcohol and pelargonic acid. The ester obtained from the reaction of isobutyl alcohol with nonanoic acid.	Skin-cond agent—emol; fragrance ingr
lsobutyl stearate/646-13-9	The ester of isobutyl alcohol and stearic acid. The ester obtained from the reaction of isobutyl alcohol with stearic acid	Skin-cond agent—emol
Isobutyl tallowate/68526-50-1	The ester of isobutyl alcohol and tallow acid. The mixture of esters obtained from the reaction of isobutyl alcohol with the fatty acids derived from tallow acid.	Skin-cond agent—emol
Isocetyl behenate/94247-28-6	The ester of isocetyl alcohol and behenic acid. The mixture of esters obtained from the reaction of branched- chain cetyl alcohols with behenic acid.	Skin-cond agent—oc
Isocetyl isodecanoate/129588-05-2	The mixture of esters obtained from the reaction of isocetyl alcohol with a branched, fatty acid containing 10 carbons in the alkyl chain. The mixture of esters obtained from the reaction of branched-chain cetyl alcohols with branched-chain decanoic acids.	Skin-cond agent—emol
Isocetyl isostearate/52006-45-8	The ester of isocetyl alcohol and isostearic acid. The mixtures of esters obtained from the reaction of branched- chain cetyl alcohols with branched-chain stearic acids.	Skin-cond agent—emol
Isocetyl laurate/89527-28-6	The ester of isocetyl alcohol and lauric acid. The mixture of esters obtained from the reaction of branched-chain cetyl alcohols with lauric acid.	Skin-cond agent—emol
Isocetyl myristate/83708-66-1	The ester of isocetyl alcohol and myristic acid. The mixture of esters obtained from the reaction of branched- chain cetyl alcohols with myristic acid.	Skin-cond agent—oc
lsocetyl palmitate/127770-27-8	The ester of isocetyl alcohol and palmitic acid. The mixture of esters obtained from the reaction of branched- chain cetyl alcohols with palmitic acid.	Skin-cond agent—emol
Isocetyl stearate/25339-09-7	The ester of isocetyl alcohol and stearic acid. The mixture of esters obtained from the reaction of branched-chain cetyl alcohols with stearic acid.	Skin-cond agent—emol
Isodecyl cocoate	The ester of branched chain decyl alcohols and coconut acid. The mixture of esters obtained from the reaction of branched-chain decyl alcohols with the fatty acids derived from coconut acid.	Skin-cond agent—emol
Isodecyl hydroxystearate/29383-27-5; 59231-36-6	The ester of branched chain decyl alcohols and 12- hydroxystearic acid. The mixture of esters obtained from the reaction of branched-chain decyl alcohols with 12 hydroxystearic acid.	Skin-cond agent—emol
Isodecyl isononanoate/41395-89-5; 59231- 35-5	The ester of branched chain decyl alcohols and a branched chain nonanoic acid. The mixture of esters obtained from the reaction of branched-chain decyl alcohols with branched-chain nonanoic acids.	Skin-cond agent—emol
lsodecyl laurate/14779-93-2; 94247-10-6	The ester of branched chain decyl alcohols and lauric acid. The mixture of esters obtained from the reaction of branched-chain decyl alcohols with lauric acid.	Skin-cond agent—emol
Isodecyl myristate/17670-91-6; 51473-24-6	The ester of branched chain decyl alcohols and myristic acid. The mixture of esters obtained from the reaction of branched-chain decyl alcohols with myristic acid.	Skin-cond agent—emol
Isodecyl neopentanoate/60209-82-7	The ester of branched chain decyl alcohols and neopentanoic acid. The mixture of esters obtained from	Skin-cond agent—emol

odecyl stearate/31565-38-5	The ester of branched decyl alcohols and stearic acid. The mixture of esters obtained from the reaction of branched-chain decyl alcohols with stearic acid.	Skin-cond agent—emol
sohexyl caprate	The ester of capric acid and a branched chain, 6-carbon alcohol. The mixture of esters obtained from the reaction of branched-chain hexyl alcohols with capric acid.	Skin-cond agent—emol
ohexyl laurate/59219-73-7	The ester of a branched chain hexyl alcohol and lauric acid. The mixture of esters obtained from the reaction of branched-chain hexyl alcohols with lauric acid.	
sohexyl neopentanoate/131141-70-3; 150588-62-8	The ester of isohexyl alcohol and neopentanoic acid that conforms to the formula. The mixture of esters obtained from the reaction of branched-chain hexyl alcohols with neopentanoic acid.	
sohexyl palmitate/55194-91-7; 59219-72-6	The ester of branched chain hexyl alcohols and palmitic acid. The mixture of esters obtained from the reaction of branched-chain hexyl alcohols with palmitic acid.	
solauryl behenate	The ester of branched chain dodecyl alcohols and behenic acid. The mixture of esters obtained from the reaction of branched-chain lauryl alcohols with behenic acid.	Skin-cond agent—oc
sononyl isononanoate/42131-25-9; 59219- 71-5	The ester of branched chain nonyl alcohols with a branched chain nonanoic acid. The mixture of esters obtained from the reaction of branched-chain nonyl alcohols with branched-chain nonanoic acids.	Skin-cond agent—emol
sooctyl caprylate/caprate	The ester of branched chain octyl alcohols with a mixture of caprylic and capric acids. The mixture of esters obtained from the reaction of branched-chain octyl alcohols with a mixture of caprylic and capric acids.	Skin-cond agent—emol; antioxidant
sooctyl tallate	The organic compound that conforms to the formula. The mixture of esters obtained from the reaction of branched-chain octyl alcohols with the fatty acids derived from tall oil.	Skin-cond agent—emol; plasticizer; solvent
sopropyl arachidate/26718-90-1	The ester of isopropyl alcohol and arachidic acid that conforms to the formula. The ester obtained from the reaction of isopropyl alcohol with arachidic acid.	Skin-cond agent—emol
opropyl avocadate/90990-05-9	The ester of isopropyl alcohol and the fatty acids derived from avocado oil. The mixture of esters obtained from the reaction of isopropyl alcohol with the fatty acids derived from avocado oil.	Skin-cond agent—emol
sopropyl babassuate	The ester of isopropyl alcohol and the fatty acids derived from Orbignya oleifera (Babassu) oil. The mixture of esters obtained from the reaction of isopropyl alcohol with the fatty acids derived from Orbignya Oleifera (Babassu) Oil.	Skin-cond agent—emol; binder; disp agent—nonsurf; emul stab
sopropyl behenate/26718-95-6	The ester of isopropyl alcohol and behenic acid. The ester obtained from the reaction of isopropyl alcohol with behenic acid.	Skin-cond agent—emol
sopropyl hydroxystearate	The ester of isopropyl alcohol and 12-hydroxystearic acid. The ester obtained from the reaction of isopropyl alcohol with 12 hydroxystearic acid.	Skin-cond agent—emol

Table 5. (continued)

Ingredient/CAS no.	Definition (italicized text generated by CIR)	Function
lsopropyl isostearate/31478-84-9; 68171- 33-5	The ester of isopropyl alcohol and isostearic acid. The mixture of esters obtained from the reaction of isopropyl alcohol with branched-chain stearic acids.	Skin-cond agent—emol; binder
lsopropyl jojobate	The ester of isopropyl alcohol and the acids derived from Simmondsia chinensis (jojoba) oil. The mixture of esters obtained from the reaction of isopropyl alcohol with the fatty acids derived from Simmondsia chinensis (jojoba) oil.	Skin-cond agent—emol
sopropyl laurate/10233-13-3	The ester of isopropyl alcohol and lauric acid. The ester obtained from the reaction of isopropyl alcohol with lauric acid.	
lsopropyl linoleate/22882-95-7	The ester of isopropyl alcohol and linoleic acid. The ester obtained from the reaction of isopropyl alcohol with linoleic acid.	
sopropyl myristate/110-27-0	The ester of isopropyl alcohol and myristic acid. The ester obtained from the reaction of isopropyl alcohol with myristic acid.	Skin-cond agent—emol; binder; fragrance ingr
lsopropyl oleate/112-11-8; 17364-07-7	The ester of isopropyl alcohol and oleic acid. The ester obtained from the reaction of isopropyl alcohol with oleic acid.	Skin-cond agent—emol; binder
sopropyl palmitate/142-91-6	The ester of isopropyl alcohol and palmitic acid. The ester obtained from the reaction of isopropyl alcohol with myristic acid.	Skin-cond agent—emol; binder; fragrance ingr
sopropyl ricinoleate/71685-99-9	The ester of isopropyl alcohol and ricinoleic acid. The ester obtained from the reaction of isopropyl alcohol with ricinoleic acid.	Skin-cond agent—emol
lsopropyl stearate/112-10-7	The ester of isopropyl alcohol and stearic acid. The ester obtained from the reaction of isopropyl alcohol with stearic acid.	
lsopropyl tallowate	The ester of isopropyl alcohol and tallow acid. The mixture of esters obtained from the reaction of isopropyl alcohol with the fatty acids derived from tallow acid.	Skin-cond agent—emol; binder
sostearyl avocadate/90990-06-0	The ester of isostearyl alcohol and the acids derived from avocado oil. The mixture of esters obtained from the reaction of branched-chain stearic alcohols with the fatty acids derived from avocado oil.	Skin-cond agent—emol
sostearyl behenate/125804-16-2	The ester of isostearyl alcohol and behenic acid. The mixture of esters obtained from the reaction of branched- chain stearic alcohols with behenic acid.	Skin-cond agent—oc
lsostearyl erucate/84605-10-7	The ester of isostearyl alcohol and erucic acid. The mixture of esters obtained from the reaction of branched- chain stearyl alcohols with erucic acid.	Skin-cond agent—oc
sostearyl hydroxystearate/162888-05-3; 338450-67-2	The ester of isostearyl alcohol and hydroxystearic acid. The mixture of esters obtained from the reaction of branched-chain stearyl alcohols with 12-hydroxystearic acid.	
lsostearyl isononanoate/90967-66-1; 163564-45-2	The ester of isostearyl alcohol and isononanoic acid. The mixture of esters obtained from the reaction of branched- chain stearyl alcohols with branched-chain nonanoic acids.	Skin-cond agent—emol
sostearyl isostearate/41669-30-1	The ester of isostearyl alcohol and isostearic acid. The mixture of esters obtained from the reaction of branched- chain stearyl alcohols with branched-chain stearic acids.	Skin-cond agent—emol; binder
sostearyl laurate	The ester of isostearyl alcohol and lauric acid. The mixture of esters obtained from the reaction of branched- chain stearyl alcohols with lauric acid	Skin-cond agent—emol
lsostearyl linoleate/127358-80-9	The ester of isostearyl alcohol and linoleic acid. The mixture of esters obtained from the reaction of branched- chain stearyl alcohols with linoleic acid.	Skin-cond agent—emol

Table 5. (continued)

Ingredient/CAS no.	Definition (italicized text generated by CIR)	Function
lsostearyl myristate/72576-81-9	The ester of isostearyl alcohol and myristic acid. The mixture of esters obtained from the reaction of branched- chain stearyl alcohols with myristic acid.	Skin-cond agent—emol; binder
Isostearyl neopentanoate/58958-60-4	The ester of isostearyl alcohol and neopentanoic acid. The mixture of esters obtained from the reaction of branched-chain stearyl alcohols with neopentanoic acid.	Skin-cond agent—emol; binder
Isostearyl palmitate/69247-83-2; 72576-80-8	The ester of isostearyl alcohol and palmitic acid. The mixture of esters obtained from the reaction of branched- chain stearyl alcohols with palmitic acid.	Skin-cond agent—emol; binder
Isotridecyl isononanoate/42131-27-1; 59231-37-7	The ester of isotridecyl alcohol and isononanoic acid. The mixture of esters obtained from the reaction of branched-chain tridecyl alcohols with branched-chain nonanoic acids.	Skin-cond agent—emol
Isotridecyl laurate/94134-83-5	The ester of isotridecyl alcohol and lauric acid that conforms generally to the formula. The mixture of esters obtained from the reaction of branched-chain tridecyl alcohols with lauric acid.	Skin-cond agent—oc; hair-cond agent
Isotridecyl myristate/96518-24-0	The ester of myristic acid and isotridecyl alcohol. The mixture of esters obtained from the reaction of branched- chain tridecyl alcohols with myristic acid.	Skin-cond agent—oc; hair-cond agent
Isotridecyl stearate/31565-37-4	The monoester of isotridecyl alcohol and stearic acid that conforms to the formula. The mixture of esters obtained from the reaction of branched-chain tridecyl alcohols with stearic acid.	Skin-cond agent—emol
Lauryl behenate/42233-07-8	The ester of lauryl alcohol and behenic acid. The ester obtained from the reaction of lauryl alcohol with behenic acid.	Skin-cond agent—oc
Lauryl cocoate	The ester of lauryl alcohol and the fatty acids derived from coconut oil. The mixture of esters obtained from the reaction of lauryl alcohol with the fatty acids derived from coconut oil.	Skin-cond agent—emol; skin-cond agent—oc
Lauryl isostearate/93803-85-1	The ester of lauryl alcohol and isostearic acid. The mixture of esters obtained from the reaction of lauryl alcohol with branched-chain stearic acids.	Skin-cond agent—emol
Lauryl laurate/13945-76-1	The ester of lauryl alcohol and lauric acid. The ester obtained from the reaction of lauryl alcohol with lauric acid.	Skin-cond agent—misc; binder; emul stab; hair-cond agent; opacifying agent
Lauryl myristate/2040-64-4	The ester of lauryl alcohol and myristic acid. The ester obtained from the reaction of lauryl alcohol with myristic acid.	Skin-cond agent—oc; hair-cond agent
Lauryl oleate/36078-10-1	Ester of lauryl alcohol and oleic acid that conforms to the formula. The ester obtained from the reaction of lauryl alcohol with oleic acid.	Skin-cond agent—oc
Lauryl palmitate/42232-29-1	The ester of lauryl alcohol and palmitic acid. The ester obtained from the reaction of lauryl alcohol with palmitic acid.	Skin-cond agent—oc
Lauryl stearate/5303-25-3	The ester of lauryl alcohol and stearic acid. The ester obtained from the reaction of lauryl alcohol with stearic acid.	Skin-cond agent—oc
Lignoceryl erucate	The ester of lignoceryl alcohol and erucic acid. The ester obtained from the reaction of lignoceryl alcohol with erucic acid.	
Myristyl isostearate/94247-26-4	The ester of myristyl alcohol and isostearic acid. The mixture of esters obtained from the reaction of myristyl alcohol with branched-chain stearic acids.	Skin-cond agent—emol
Myristyl laurate/22412-97-1	The ester of myristyl alcohol and lauric acid. The ester obtained from the reaction of myristyl alcohol with lauric acid.	Surf—emulsifying agent

Table 5. (continued)

Ingredient/CAS no.	Definition (italicized text generated by CIR)	Function
Myristyl myristate/3234-85-3	The ester of myristyl alcohol and myristic acid. The ester obtained from the reaction of myristyl alcohol with myristic acid	Skin-cond agent—oc
Yyristyl neopentanoate/144610-93-5	The ester of myristyl alcohol and neopentanoic acid. The ester obtained from the reaction of myristyl alcohol with neopentanoic acid.	Skin-cond agent—emol
1yristyl stearate/17661-50-6	The ester of myristyl alcohol and stearic acid. The ester obtained from the reaction of myristyl alcohol and stearic acid.	Skin-cond agent—oc
Dctyldecyl oleate	The ester of octyldecanol and oleic acid. The ester obtained from the reaction of 2-octyldecanol with oleic acid.	Skin-cond agent-emol
Dctyldodecyl avocadoate	The ester of octyldodecanol and the fatty acids derived from avocado oil. The mixture of esters obtained from the reaction of 2-octyldodecanol with the fatty acids derived from avocado oil.	Skin-cond agent—emol
Octyldodecyl beeswax	The ester of octyldodecanol and beeswax acid. The mixture of esters obtained from the reaction of 2- octyldodecanol with a mixture of straight-chain fatty acids, containing 24 to 36 carbons in alkyl chain length (beeswax acid).	Skin-cond agent—emol
Octyldodecyl behenate/125804-08-2	The ester of octyldodecanol and behenic acid that conforms to the formula. The ester obtained from the reaction of 2-octyldodecanol with behenic acid.	Skin-cond agent—oc
Dctyldodecyl cocoate	The ester of octyldodecanol and coconut acid. The mixture of esters obtained from the reaction of 2- octyldodecanol and the fatty-acids derived from coconut acid.	Skin-cond agent—emol
Octyldodecyl erucate/88103-59-7	The ester of octyldodecanol and erucic acid. The ester obtained from the reaction of 2-octyldodecanol with erucic acid.	Skin-cond agent—oc
Octyldodecyl hydroxystearate/308122-33-0	The ester of octyldodecanol and 12-hydroxystearic acid. The ester obtained from the reaction of 2-octyldodecanol and 12 hydroxystearic acid.	Skin-cond agent—oc
Octyldodecyl isostearate/93803-87-3	The ester of octyldodecanol and isostearic acid. The mixture of esters obtained from the reaction of 2- octyldodecanol WITH isostearic acid.	Skin-cond agent—oc
Octyldodecyl meadowfoamate	The ester of octyldodecanol and the fatty acids derived from Limnanthes alba (meadowfoam) seed oil. The mixture of esters obtained from the reaction of 2 octyldodecanol with the fatty acids derived from Limnanthes alba (meadowfoam) seed oil.	Skin-cond agent—oc
Octyldodecyl myristate/22766-83-2; 83826-43-1	The ester of octyldodecanol and myristic acid. The ester obtained from the reaction of 2 octyldodecanol with myristic acid.	Skin-cond agent—oc
Octyldodecyl neodecanoate/1004272-41-6	The ester of octyldodecanol and neodecanoic acid. The ester obtained from the reaction of 2-octyldodecanol with neodecanoic acid.	Skin-cond agent—emol
Dctyldodecyl neopentanoate/158567-66-9	The ester of octyldodecanol and neopentanoic acid. The ester obtained from the reaction of 2-octyldodecanol with neopentanoic acid.	Skin-cond agent—emol
Dctyldodecyl octyldodecanoate	The ester of octyldecanol and octyldodecanoic acid. The ester obtained from the reaction of 2-octyldecanol with 2 octyldodecanoic acid.	Skin-cond agent—oc
Octyldodecyl oleate/22801-45-2	The ester of octyldodecanol and oleic acid. The ester obtained from the reaction of 2-octyldodecanol with oleic acid.	Skin-cond agent—oc

Table 5. (continued)

Ingredient/CAS no.	Definition (italicized text generated by CIR)	Function
Octyldodecyl olivate/22801-45-2	The ester of octyldodecanol and the fatty acids derived from Olea europaea (olive) oil. The ester obtained from the reaction of 2-octyldodecanol with the fatty acids derived from Olea europaea (olive) oil.	
Octyldodecyl ricinoleate/79490-62-3; 125093-27-8	The ester of octyldodecanol and ricinoleic acid. The ester obtained from the reaction of 2-octyldodecanol with ricinoleic acid.	Hair-cond agent; shampoo
Octyldodecyl safflowerate	The ester of octyldodecanol and the fatty acids derived from Carthamus tinctorius (safflower) oil. The ester obtained from the reaction of 2-octyldodecanol with the fatty acids derived from Carthamus tinctorius (safflower) oil.	Skin-cond agent—emol
Octyldodecyl stearate/22766-82-1	The ester of octyldodecanol and stearic acid. The ester obtained from the reaction of 2-octyldodecanol with stearic acid.	Skin-cond agent—oc
Oleyl arachidate/22393-96-0; 156952-79-3	The ester of oleyl alcohol and arachidic acid. The ester obtained from the reaction of oleyl alcohol with arachidic acid.	Skin-cond agent—oc
Oleyl erucate/17673-56-2; 143485-69-2	The ester of oleyl alcohol and erucic acid. The ester obtained from the reaction of oleyl alcohol with erucic acid.	Skin-cond agent—oc
Oleyl linoleate/17673-59-5	The ester of oleyl alcohol and linoleic acid. The ester obtained from the reaction of oleyl alcohol with linoleic acid.	Skin-cond agent—oc; hair-cond agent
Oleyl myristate/22393-93-7	The ester of oleyl alcohol and myristic acid. The ester obtained from the reaction of oleyl alcohol with myristic acid.	Skin-cond agent—oc; hair-cond agent
Oleyl oleate/3687-45-4; 17363-94-9	The ester of oleyl alcohol and oleic acid. The ester obtained from the reaction of oleyl alcohol with oleic acid.	Skin-cond agent—emol; skin-cond agent-emol
Oleyl stearate/33057-39-5; 17673-50-6	The ester of oleyl alcohol and stearic acid. The ester obtained from the reaction of oleyl alcohol with stearic acid.	Skin-cond agent—oc; hair-cond agent
Propylheptyl caprylate/868839-23-0	The organic compound that conforms to the formula. The ester obtained from the reaction of 2-propylheptanol with caprylic acid.	Skin-cond agent—emol
Stearyl beeswax/42233-11-4	The ester of stearyl alcohol and beeswax acid. The mixture of esters obtained from the reaction of stearyl alcohol with a mixture of straight-chain fatty acids, containing 24 to 36 carbons in alkyl chain length (beeswax acid).	Skin-cond agent—oc
Stearyl behenate/24271-12-3	The ester of stearyl alcohol and behenic acid. The ester obtained from the reaction of stearyl alcohol with behenic acid.	
Stearyl caprylate/18312-31-7	The ester of stearyl alcohol and caprylic acid. The ester obtained from the reaction of stearyl alcohol with caprylic acid.	
Stearyl erucate/86601-84-5; 96810-34-3	The ester of stearyl alcohol and erucic acid. The ester obtained from the reaction of stearyl alcohol with erucic acid.	Visc incr agent—nonaq
Stearyl heptanoate/66009-41-4	The ester of stearyl alcohol and heptanoic acid. The ester obtained from the reaction of stearyl alcohol with heptanoic acid.	Skin-cond agent—oc
Stearyl Linoleate/17673-53-9	The ester of stearyl alcohol and linoleic acid that conforms to the formula. The ester obtained from the reaction of stearyl alcohol with linoleic acid.	Skin-cond agent—oc; visc incr agent— nonaq
Stearyl olivate	The ester of stearyl alcohol and the fatty acids derived from Olea europaea (olive) oil. The ester obtained from	Skin-cond agent—emol; surf— emulsifying agent

Table 5. (continued)

Ingredient/CAS no.	Definition (italicized text generated by CIR)	Function
	the reaction of stearyl alcohol with the fatty acids derived	
Stearyl palmitate/2598-99-4	from Olea europaea (olive) oil. The ester of stearyl alcohol and palmitic acid. The ester obtained from the reaction of stearyl alcohol with palmitic acid.	Skin-cond agent—misc; hair-cond agent; binder; emul stab; humectant; film former; opacifying agent
Stearyl stearate/2778-96-3	The ester of stearyl alcohol and stearic acid. The ester obtained from the reaction of stearyl alcohol with stearic acid.	Skin-cond agent—oc; visc incr agent— nonaq
Tetradecyleicosyl stearate	The ester of myristyleicosanol and stearic acid. The ester obtained from the reaction of myristyleicosanol with stearic acid.	Skin-cond agent—oc
Tetradecyloctadecyl behenate	The ester of tetradecyloctadecanol and behenic acid. The ester obtained from the reaction of tetradecyloctadecanol with behenic acid.	Skin-cond agent—oc; binder; emul stab film former; opacifying agent
Tetradecyloctadecyl hexyldecanoate/ 93982-00-4	The organic compound that conforms to the formula. The ester obtained from the reaction of 2 tetradecyloctyldecanol with 2-hexyldecanoic acid.	Skin-cond agent—emol
Tetradecyloctadecyl myristate	The ester of tetradecyloctadecanol and myristic acid. The ester obtained from the reaction of 2 tetradecyloctyldecanol with myristic acid.	Skin-cond agent—oc; binder; emul stab film former; opacifying agent
Tetradecyloctadecyl stearate	The ester of tetradecyloctadecanol and stearic acid. The ester obtained from the reaction of 2-tetradecyloctadecanol with stearic acid.	Skin-cond agent—oc; binder; emul stab film former; opacifying agent
Tetradecylpropionates	An isomeric mixture of esters consisting chiefly of 2 tetradecylproprionate, 3-tetradecylproprionate, and 4-tetradecylproprionate. The mixture of esters obtained from the reaction of a mixture of 2-, 3-, and 4-tetradecanols with propionic acid.	Skin-cond agent—emol; solvent
Tridecyl behenate/42233-08-9	The ester of tridecyl alcohol and behenic acid. The ester obtained from the reaction of tridecyl alcohol with behenic acid.	Skin-cond agent—oc
Tridecyl cocoate	The ester of tridecyl alcohol and coconut acid. The mixture of esters obtained from the reaction of tridecyl alcohol with the fatty acids derived from coconut acid.	Skin-cond agent—oc
Tridecyl erucate/131154-74-0; 221048-36-8	The ester of tridecyl alcohol and erucic acid. The ester obtained from the reaction of tridecyl alcohol with erucic acid.	Skin-cond agent—oc
Tridecyl isononanoate/125804-18-4	The ester of tridecyl alcohol and isononanoic acid that conforms to the formula. The ester of tridecyl alcohol and branched-chain nonanoic acids.	Skin-cond agent—emol
Tridecyl laurate/36665-67-5	The ester of tridecyl alcohol and lauric acid that conforms to the formula. The ester obtained from the reaction of tridecyl alcohol with lauric acid.	Skin-cond agent—oc
Tridecyl myristate/36617-27-3	The ester of tridecyl alcohol and myristic acid. The ester obtained from the reaction of tridecyl alcohol with myristic acid.	Skin-cond agent—oc
Tridecyl neopentanoate/106436-39-9; 105859-93-6	The ester of tridecyl alcohol and neopentanoic acid. The ester obtained from the reaction of tridecyl alcohol with neopentanoic acid.	Skin-cond agent—emol
Tridecyl stearate/31556-45-3	The ester of tridecyl alcohol and stearic acid. The ester obtained from the reaction of tridecyl alcohol with stearic acid.	Skin-cond agent—emol

Abbreviations: cond, conditioning; disp, dispersing; emol, emollient; emul, emulsion; incr, increasing; ingr, ingredient; misc, miscellaneous; nonaq, nonaqueous; nonsurf, nonsurfactant; oc, occlusive; solub, solubilizing; stab, stabilizer; surf, surfactant; visc, viscosity.

### Table 6. Methods of Manufacture.

Ingredient	Method of manufacture	Reference
Arachidyl propionate	Manufactured as a mixture of the esters of the C <sub>18</sub> –C <sub>28</sub> fatty alcohols, of which C <sub>20</sub> fatty alcohol ester is the major constituent	3
Butyl oleate	Reaction of butanol and oleic acid in the presence of dihydrogen phosphate prepared from <i>n</i> -butanol and oleic acid by heating, with sulfuric acid as a catalyst	36 37,38
	Esterification of oleic acid with butyl alcohol in $n$ -hexane in the presence of the macroporous sulfonic	39 40
	resin K2411 Synthesized with <i>Candida antarctica</i> lipase catalyst or using a sodium alcoholate catalyst	41
	Esterification of oleic acid with butanol in the presence of <i>p</i> -toluene sulfonic acid Lipase-catalyzed oleic acid esterification by <i>n</i> -butyl alcohol in almost nonaqueous media without an	
	organic solvent	22
Butyl myristate Butyl stearate	Derived from the esterification of myristic acid and butyl alcohol in the presence of an acid catalyst The esterification of stearic acid with butyl alcohol; the reaction products are refined by catalyst neutralization, vacuum distillation, or various decolorization-deodorization techniques to remove	22 7
	traces of alcohol	42
Cetyl behenate	Esterification of behenic acid with cetyl alcohol using <i>n</i> -butyl benzene as the solvent and tetra <i>n</i> -butyl titanate as the catalyst	
Cetyl oleate	Cetyl alcohol and oleic acid were dissolved in benzene and heated, using sulfuric acid as a catalyst; the	43 39
	mixture was then washed, the benzene filtered and removed by vacuum distillation, and the ester separated twice by distillation esterification of oleic acid with cetyl alcohol in <i>n</i> -hexane in the presence	44
	of <i>p</i> -toluene sulfonic acid Lipase-catalyzed oleic acid esterification by cetyl alcohol in almost nonaqueous media without an organic solvent	
Cetyl stearate	The esterification of stearic acid with cetyl alcohol; the reaction products are refined by catalyst neutralization, vacuum distillation, or various decolorization–deodorization techniques to remove	7
Ethylhexyl laurate	traces of alcohol Coproduced by the lipase-catalyzed acylation of racemic alcohol and vinyl laurate in the production of (R)-2-ethylhexanol	45
Ethylhexyl oleate	Synthesized with <i>Candida antarctica</i> lipase catalyst or using a sodium alcoholate catalyst	40
Ethylhexyl stearate	The esterification of stearic acid with octyl alcohol; the reaction products are refined by catalyst neutralization, vacuum distillation, or various decolorization–deodorization techniques to remove traces of alcohol	7
Isobutyl stearate	The esterification of stearic acid with isobutyl alcohol; the reaction products are refined by catalyst neutralization, vacuum distillation, or various decolorization–deodorization techniques to remove traces of alcohol	7
lsocetyl myristate	The esterification of isocetyl alcohol and myristic acid	5
Isocetyl stearate	The esterification of stearic acid with isocetyl alcohol; the reaction products are refined by catalyst neutralization, vacuum distillation, or various decolorization–deodorization techniques to remove traces of alcohol can be made by heating with or without acid catalyst	7
lsopropyl arachidate	Arachidic acid was treated with isopropyl alcohol in large molar excess, <i>p</i> -toluene sulfonic acid was the catalyst	46
lsopropyl laurate	Lauric acid was treated with isopropyl alcohol in large molar excess, p-toluene sulfonic acid was the catalyst	46
lsopropyl myristate	Commercially produced by distillation, which is preceded by the esterification of myristic acid and isopropanol, in the presence of an acid catalyst	6
lsopropyl oleate	Esterification of oleic acid with isopropyl alcohol in <i>n</i> -hexane in the presence of K2411	39
	Synthesized with Candida antarctica lipase catalyst or using a sodium alcoholate catalyst	40 7
lsopropyl stearate	The esterification of stearic acid with isopropyl alcohol; the reaction products are refined by catalyst neutralization, vacuum distillation, or various decolorization–deodorization techniques to remove traces of alcohol	
Isostearyl neopentanoate Lauryl behenate	Prepared by esterifying isostearyl alcohol with neopentanoic acid in the presence of a catalyst Esterification of behenic acid with lauryl alcohol using <i>n</i> -butyl benzene as the solvent and tetra <i>n</i> -butyl titanate as the catalyst	21 42
Lauryl oleate	Esterification of oleic acid with lauryl alcohol in <i>n</i> -hexane in the presence of <i>p</i> -toluene sulfonic acid Synthesized with <i>Candida antarctica</i> lipase catalyst or using a sodium alcoholate catalyst	39
Lauryl palmitate	Lipase-catalyzed esterification of palmitic acid and lauryl alcohol using Novozym 435 as the biocatalyst	49
Myristyl laurate	The fatty acid chloride was reacted with myristic acid in the presence of pyridine, using diethyl ether as the solvent	47
Myristyl myristate	Produced by the esterification of myristic acid and myristyl alcohol in the presence of an acid catalyst	6

### Methods of Manufacture

Oleyl stearate

Most of these alkyl esters are produced synthetically via classical Fischer type esterification methods (ie, reaction of a carboxylic acid with an alcohol to produce a carboxylic ester; Table 1), although the reaction may be promoted by acid or base catalysis, or by the use of an acid chloride.

solvent

Some of the natural source ingredients in this review may be produced by transesterification (ie, exchange of alcohol moieties to create a different ester product). For example, the triglycerides (ie, glyceryl triesters) in natural oils can be reacted with alcohols to produce new monoesters (and diglycerides, monoglycerides, and glycerin, depending on reaction stoichiometry). Available methods of manufacture are summarized in Table 6.<sup>3,5-7,21,22,36-51</sup>

# Physical and Chemical Properties

Alkyl esters are hydrophobic materials that range from oils, at the lowest molecular weights/shortest chain lengths, to waxy solids, at the highest molecular weights/longest chain lengths. Physical and chemical properties data are provided in Table 7.<sup>3,5-7,9,10,12,13,15,21,22,36,40-43,45-48,50,52-63</sup>

### Impurities

One published reference stated that in the synthesis of oleate esters using sodium alcoholates (base catalyst), methyl oleate was the major impurity.<sup>40</sup> (The safety assessment of decyl and isodecyl oleate includes and took into account toxicity data on methyl oleate.<sup>13</sup>)

### Use

### Cosmetic

The alkyl esters are reported to function in cosmetics mostly as skin-conditioning agents.<sup>1</sup> Some of the alkyl esters are reported to have additional functions; for example, isooctyl tallate is reported to also function as a plasticizer and solvent, and tetradecylpropionates is reported to function as a solvent (Table 5).

The Food and Drug Administration (FDA) collects information from manufacturers on the use of individual ingredients in cosmetic formulations as a function of cosmetic product category in its Voluntary Cosmetic Registration Program (VCRP). The VCRP data obtained from the FDA<sup>64</sup> in 2013 and data received in response to a survey of the maximum reported use concentration by category conducted by the Personal Care Products Council (Council)<sup>65-68</sup> indicate that 112 of the 237 alkyl esters named in this safety assessment are currently used in cosmetic formulations. Ethylhexyl palmitate has the most reported uses, 1525, followed by isopropyl myristate, 1182 reported uses, and isopropyl palmitate, 1125 reported uses (cetyl esters is reported to be used in 476 cosmetic formulations). Many of the alkyl esters are used at high concentrations in cosmetic formulations. Ethylhexyl palmitate had the highest reported use concentration, 78% in body and hand preparations, followed by isopropyl myristate, which is used at 77.3% in other hair grooming aids and 76.6% in aerosol hair spray formulations.

The frequency and concentration of use data and the historical data of previously reviewed ingredients are summarized in Table 8. The ingredients not in use according to the VCRP and industry survey are listed in Table 9.<sup>65-67</sup>

In quite a few cases, reports of uses were received in the VCRP, but no concentration of use data are available. For example, caprylyl caprylate is reported to be used in 11 cosmetic formulations, but no use concentration data were reported. Additionally, there were quite a few instances in which no reported uses were received in the VCRP, but a use concentration was provided in the industry survey. For example, oleyl linoleate was not reported in the VCRP to be in use, but the industry survey indicated that it is used in leave-on formulations at up to 11%. It should be presumed in these cases that there is at least one use in every category for which a concentration is reported.

(continued)

Some alkyl esters are reported to be used in baby skin products, to be used in products applied to the eye area or mucous membranes, or in products that could possibly be ingested. Additionally, some of the alkyl esters are used in cosmetic sprays and could possibly be inhaled. Examples of sprays at the highest concentrations of use are 76.6% isopropyl myristate in hair sprays, 45% ethylhexyl palmitate in indoor tanning preparations, and 23% isopropyl myristate in deodorant formulations. In practice, 95% to 99% of the droplets/particles released from cosmetic sprays have aerodynamic equivalent diameters >10  $\mu$ m, with propellant sprays yielding a greater fraction of droplets/particles <10  $\mu$ m compared with pump

<sup>a</sup>Because each ingredient may be used in cosmetics with multiple exposure types, the sum of all exposure types may not equal the sum of total uses.

<sup>b</sup>Prior to 2012, concentration of use surveys did not request specific information about whether or not products are sprays.

<sup>c</sup>It is not known whether or not the product is a spray.

<sup>d</sup>Includes suntan products, and it is not known whether the reported product is a spray.

<sup>e</sup>Product categories generic, giving no indication of duration of use or exposure type.

sprays.<sup>69,70</sup> Therefore, most droplets/particles incidentally inhaled from cosmetic sprays would be deposited in the naso-pharyngeal and thoracic regions of the respiratory tract and would not be respirable (ie, they would not enter the lungs) to any appreciable amount.<sup>71,72</sup> There is some evidence indicating that deodorant spray products can release substantially larger fractions of particulates having aerodynamic equivalent diameters in the range considered to be respirable.<sup>72</sup> However, the information is not sufficient to determine whether significantly greater lung exposures result from the use of deodorant sprays compared to other cosmetic sprays.

All of the alkyl esters named in this report, with the exception of behenyl olivate and hexyldodecyl/octyldecyl hydroxystearate, are listed in the European Union inventory of cosmetic ingredients.<sup>73</sup>

### Noncosmetic

Isoamyl laurate and butyl stearate are approved as direct food additives for use as a flavor substance adjuvant (21CFR172.515). Many of the alkyl esters are approved as indirect food additives, as listed in the Code of Federal Regulations Title 21. Examples of noncosmetic uses of some of the alkyl esters are provided (Table 10).<sup>42,45,74</sup>

### Toxicokinetics

## Absorption, Distribution, Metabolism, and Excretion

*Cetyl myristoleate*. Rats were fed chow containing 2% cetyl myristoleate or untreated feed for 2 hours.<sup>51</sup> Hydrolysis was evaluated by the presence of cetyl alcohol, and no cetyl alcohol was found in the stomach, intestinal content, or intestinal mucosa in either group. Additional details were not provided.

*Cetyl oleate*. Groups of 5 male albino rats were fed a diet containing 20% cetyl oleate for 9 days; control groups were fed a fat-free diet or a diet containing 20% cottonseed oil.<sup>43</sup> The animals were given 12 g of diet per day. The absorption of cetyl oleate was reported to be 75.3%. By day 2 of the study, the animals fed cetyl oleate developed seborrhea, which progressively increased with feeding. The animals were killed after the termination of dosing, and microscopic examination reported thickening and hyperemia of the intestinal wall. The exuded lipid was identified as cetyl oleate. The researchers stated that the absorbability and seborrhea suggested that cetyl oleate was not hydrolyzed in the gut.

The researchers then dosed groups of 6 male rats with 2 g of cetyl oleate or an equal mixture of cetyl oleate + tributyrin by gavage, and the animals were fed a fat-free diet. Control

animals were dosed with sucrose. The animals were fasted overnight on day 10 of dosing, and 2 animals were then killed. Two of the remaining animals were killed 1 hour and 2 were killed 3 hours after a final dose. Seborrhea was observed in both test groups; only cetyl oleate was recovered from the exuded lipid in both test groups. Intestinal weight was markedly increased in the cetyl oleate + tributyrin group. The free fatty acid content of the stomach 3 hours after dosing and of the small intestine 1 and 3 hours after dosing was increased in the group dosed with cetyl oleate (only) when compared to controls. In the cetyl oleate + butyrin group, the free fatty acid content of the stomach as hours, and in the small intestine it was increased after 1 hour.

### Dermal Penetration

*lsopropyl myristate*. Isopropyl myristate, as a nonpolar penetration enhancer, is largely retained in the stratum corneum.<sup>75</sup> It was not detected in the receptor fluid of flow-through diffusion cells in in vitro skin permeation experiments using human epidermis (stratum corneum and viable epidermis) and dermis (varying thickness).

*Isostearyl isostearate.* Predeuterated isostearyl isostearate, 7  $\mu$ L/ cm<sup>2</sup>, was applied neat to a 2 × 8 cm<sup>2</sup> site on the ventral forearm of 14 humans for 3 hours under nonocclusive conditions.<sup>76</sup> The test site was tape-stripped 3 hours after application, and

Ingredient	Noncosmetic use	Reference
Behenyl behenate	Used in mold releasing agents in methyl acrylamide polymer	42
Butyl oleate	Indirect food additive as a plasticizer in rubber articles; biodiesel additive; polyvinylchloride plasticizer; water-resisting agent; in hydraulic fluids	21CFR177.2600 74
Ethylhexyl laurate	Lubricant for friction and in paper industry; activity enhancer for pesticides	45
Isoamyl laurate	Direct food additive as a synthetic flavoring substance and adjuvant	21CFR172.515
Isobutyl palmitate	Indirect food additive used in fiber finishing or in textile fibers	21CFR177.2260; 21CFR177.2800
lsooctyl tallate	Indirect food additive as a plasticizer in rubber articles	21CFR177.2600
Isopropyl laurate	Indirect food additive as a lubricant in the manufacture of metallic articles; use level not to exceed 10% by weight	21CFR178.3910
lsopropyl oleate	Indirect food additive as a lubricant in the manufacture of metallic articles or in mineral oil lubricants with incidental food contact	21CFR178.3910; 21CFR178.3570

Table I	0.	Examples	of	Noncosmetic	Uses
---------	----	----------	----	-------------	------

attenuated total reflectance-Fourier transform infrared spectra measurements were determined. The researchers stated the most of the isostearyl isostearate was located at the surface of the stratum corneum. The percentage recovery of the amount applied was not specified.

### Penetration Enhancement

Isopropyl myristate is a nonpolar penetration enhancer in pharmaceutical and cosmetic preparations. A 50:50 isopropanol– isopropyl myristate binary enhancer synergistically increased the transport of estradiol across a 2-layer human epidermis in vitro.<sup>75</sup> The average thicknesses (2 donors) of the stratum corneum and viable epidermis were 14 and 60  $\mu$ m, respectively. Saturated estradiol solutions of the binary enhancer were used in the donor and the receiver. The isopropanol–isopropyl myristate binary volume ratio varied from 0:100, 25:75, 50:50, 75:25, and 100:0 isopropanol–isopropyl myristate. The permeability coefficient was lowest for neat isopropyl myristate, increased with increasing isopropanol until a 50:50 ratio was reached, and then was relatively constant as the percentage of isopropanol increased.

Isopropyl palmitate is reported to be used in topical formulations as a lipid layer penetration enhancer.<sup>77</sup> The skin penetration of 3 lipophilic compounds (partition coefficient order: gliclazide > nimesulfide > oxaproxin) and 1 hydrophilic compound (ribavirin) across excised rat abdominal skin after 2hour pretreatment with 5% to 20% (w/w) isopropyl palmitate in ethanol was determined.<sup>78</sup> All pretreatment solutions produced a significant increase in the flux and permeation of all 4 compounds; the effectiveness was concentration dependent.

Skin penetration enhancement with isostearyl isostearate was evaluated in vitro using excised human abdominal skin by measuring the permeation of 5-fluorouracil through the skin after 6 hours.<sup>60</sup> Both isostearyl isostearate and the buffer control increased the rate of penetration of 5-fluorouracil, but isostearyl isostearate was not a penetration enhancer.

The effect of alkyl esters on the penetration of indomethacin in vitro through excised hairless rat skin was examined.<sup>79</sup> The permeation of 1% indomethacin from suspensions and from hydrogenated phospholipid gels containing cetyl caprylate, ethylhexyl palmitate, isocetyl palmitate, isocetyl isostearate, or isocetyl stearate was determined. The permeation rate of indomethacin from the esters increases with increased solubility of the drug in the ester. The solubility of indomethacin in liquid paraffin is very low, and there was no permeation of indomethacin from liquid paraffin after 10 hours. Permeation from the isocetyl isostearate suspension was 3.8  $\mu$ g/cm<sup>2</sup> after 10 hours, and isocetyl isostearate was the alkyl ester that indomethacin was least soluble in, but in comparison to liquid paraffin, solubility was increased 60-fold. (Of the esters studied, indomethacin had the highest solubility in and permeation from ethylhexyl isononanoate, an alkyl ester previously reviewed by the CIR, with approximately 23  $\mu$ g/cm<sup>2</sup> permeating in 10 hours.) Permeation rates (and solubility) were higher in gels formed by a hydrogenated phospholipid than from suspensions. In all cases, a linear relationship existed between the cumulative amounts of indomethacin that permeated from any ester from 4 to 10 hours. In another study, the permeation rate of ketoprofen from an alkyl ester suspension through excised hairless rat skin was also proportional to its solubility in the suspension.80

# Animal Toxicology

# Single-Dose (Acute) Toxicity

## Dermal

*Butyl oleate*. The acute dermal toxicity of butyl oleate was determined in rabbits.<sup>81</sup> A single dose of 5 g/kg body weight (bw) butyl oleate was applied to the skin of 10 rabbits. Slight erythema was observed in 3 rabbits and moderate erythema in 7, and slight edema was observed in 6 rabbits and moderate edema in 3. None of the animals died, and the dermal median lethal dose (LD<sub>50</sub>) of butyl oleate in rabbits was >5 g/kg bw. Additional details were not provided.

*Propylheptyl caprylate.* Groups of 5 male and 5 female Wistar rats were dosed dermally with a single semiocclusive application of 0 or 2000 mg/kg bw propylheptyl caprylate, applied neat.<sup>50</sup> No irritation or treatment-related signs of toxicity were

reported, and the dermal  $LD_{50}$  of propylheptyl caprylate was >2 g/kg bw.

*Ethylhexyl laurate.* The dermal  $LD_{50}$  of ethylhexyl laurate in rats was >3 g/kg bw.<sup>56</sup> Additional details were not provided.

#### Oral

*Butyl oleate.* A group of 10 rats were dosed orally with 5 g/kg bw butyl oleate.<sup>81</sup> None of the animals died. The oral  $LD_{50}$  of butyl oleate in rats was >5 g/kg bw.

*Cetyl myristoleate.* Five male and five female white rats were dosed orally with 5 g/kg bw cetyl myristoleate.<sup>51</sup> There was no mortality, and the  $LD_{50}$  was >5 g/kg bw.

**Propylheptyl caprylate.** Six female Wistar rats were dosed orally with 2 g/kg bw propylheptyl caprylate in corn oil.<sup>50</sup> All animals had hunched posture and piloerection for 6 hours after dosing, but none of the animals died during the study. The oral  $LD_{50}$  of propylheptyl caprylate was >2 mg/kg bw.

*Ethylhexyl laurate.* The oral  $LD_{50}$  of ethylhexyl laurate in rats was >2 g/kg bw.<sup>56</sup> (Details were not provided.)

*Isodecyl laurate.* The oral  $LD_{50}$  of isodecyl laurate in Wistar rats was >13 g/kg bw (>15 mL/kg bw).<sup>58</sup> Additional details were not provided.

### Inhalation

Ethylhexyl laurate. The inhalation median lethal concentration  $(LC_{50})$  of ethylhexyl laurate in rats was >230 ppm.<sup>56</sup> Additional details were not provided.

### Repeated-Dose Toxicity

#### Oral

Propylheptyl caprylate. Groups of 10 male and 10 female CD/ Crl:CD(SD) rats were dosed daily by gavage with 0, 100, 300, or 1000 mg/kg bw/d propylheptyl caprylate in soybean oil for 90 days.<sup>50</sup> No test article-related deaths occurred. No test article-related clinical signs of toxicity or changes in bws or feed consumption, changes in the estrous cycle, or effects on sperm were observed, and there were no effects on any clinical chemistry or hematology parameters. A statistically significant decrease in the urinary pH values in males and females of the 300 and 1000 mg/kg bw/d groups was considered to be related to treatment. Absolute and relative liver weights were statistically significantly increased in animals of the high-dose group. The change in urinary pH was attributed to the possibility of an acidic metabolite being eliminated in large doses, and the changes in liver weight were considered a nonspecific adaptive change to the liver workload at the high does, therefore, the noobservable adverse-effect level (NOAEL) was established as  $\geq$ 1000 mg/mg bw/d propylheptyl caprylate.

*Ethylhexyl laurate*. Male and female Sprague-Dawley rats, number per group not specified, were dosed with 0, 100, 300, or 1000 mg/kg bw ethylhexyl laurate once daily, 5 days/wk, by

gavage for 28 days.<sup>56</sup> The NOAEL was 1000 mg/kg bw. No additional details were provided.

*Isodecyl laurate.* Male Wistar rats, number per group not specified, were dosed orally with 500, 1500, or 4500 mg/kg/d isodecyl laurate, 6 days/wk, for 4 weeks.<sup>58</sup> No treatment-related changes were observed at any dose level. No additional details were provided.

## Genotoxicity

### In Vitro

**Propylheptyl caprylate.** The mutagenic potential of 0.31, 0.62, 1.25, 2.5, and 5.0  $\mu$ L/plate propylheptyl caprylate was evaluated in an Ames test, with and without metabolic activation, using *Salmonella typhimurium* strains TA1535, TA1573, TA98, TA100, and TA102.<sup>50</sup> Dimethyl sulfoxide served as the vehicle. Propylheptyl caprylate was not mutagenic with or without metabolic activation.

An in vitro mammalian chromosomal aberration assay was performed in Chinese hamster V79 lung fibroblasts with 22.4 to 2480  $\mu$ g/mL propylheptyl caprylate.<sup>50</sup> The exposure time was 4 hours with metabolic activation and ranged from 4 to 28 hours without metabolic activation. Propylheptyl caprylate was not clastogenic to Chinese hamster V79 lung fibroblasts.

*Ethylhexyl laurate.* Ethylhexyl laurate, tested at doses 8, 40, 200, 1000, and 5000  $\mu$ g/plate, was not mutagenic in an Ames test performed in *S typhimurium* (strains not specified) with and without metabolic activation.<sup>56</sup>

*Isodecyl laurate.* An Ames test was performed with 312 to 5000  $\mu$ g/plate isodecyl laurate.<sup>58</sup> Isodecyl laurate was not mutagenic toward *S typhimurium* strains TA97, TA98, TA100, and TA102. No additional details were provided.

## In Vivo

*Ethylhexyl laurate.* A mouse micronucleus test was performed in which male and female mice were dosed by gavage with 0, 1.25, 2.5, and 5.0 mL/kg ethylhexyl laurate.<sup>56</sup> The animals were killed after 4, 48, or 72 hours. Ethylhexyl laurate was not genotoxic in this assay.

## Carcinogenicity

Published carcinogenicity data were not found and unpublished data were not provided.

## Irritation and Sensitization

Mixed results were reported in irritation testing in both nonhuman and human testing with some alkyl esters (Table 11). In rabbits, propylheptyl caprylate was moderately irritating<sup>50</sup> and ethylhexyl laurate was not irritating.<sup>56</sup> A formulation containing 10% isopropyl palmitate was moderately irritating in male hairless guinea pigs.<sup>77</sup> In one study in which it was unclear

Test article	Concentration/dose Test population	Test population	Procedure	Results	Reference
			Dermal irritation		
			Nonhuman		
		Pr	Propylheptyl caprylate		
Propylheptyl caprylate	Applied neat; amount applied was not specified	SPF albino rabbits, 3 females	4-H semiocclusive patch; mean scores were calculated on the bases of 24, 48, and 72- hour scores, with a maximum value of 3	Moderately irritating Erythema: scores were 2, 2, and 2.33 Edema: scores were 0.33, 1, and 0	50
		-	Isopropyl palmitate		
Cream formulation consisting of 10% isopropyl palmitate, carbomers, sorbitan oleate, paraffin liquid, propylene glycol, trometamol, and purified water	5 mg cream/cm <sup>2</sup> applied 2×/d	Hairless guinea pigs, I 5 males	Tolerance test: open applications were made on each side of the dorsal trunk for 4 days; test sites were scored immediately prior to each application and at the end of the study on scale of 0-4 for erythema and 0-3 for both scaling and fissures for a total possible score of 10 Cream without isopropyl palmitate served as the negative vehicle control; cream consisting of glyceryl stearate, PEG-100 stearate, cetostearyl alcohol, paraffin oil, propylene glycol, citric acid monohydrate, sodium citrate was used as a positive vehicle control	Cream with 10% isopropyl palmitate, but not without it, caused a moderate degree of irritation The clinical scores as assessed by the AUC (given as the mean; study days were plotted on the x-axis and average clinical score on the y-axis) were 1.10, 7.25, and 9.10 for the negative control, the cream containing isopropyl palmitate, and the positive control, respectively	1
			Ethylhexyl laurate		
Ethylhexyl laurate	0.5 g	Rabbits, number not specified	OECD Guideline 404 for "acute dermal irritation/corrosion" testing: a semioocclusive patch is applied to an approximately 6 cm <sup>2</sup> area for 4 hours; erythema and edema are each scored on a scale of 0-4	Slightly irritating using OECD guidelines Nonirritating according to the EC classification	56
			Isodecyl laurate		
Isodecyl laurate	30 in liquid paraffin 500 mg/dose	Unclear whether rats or rabbits were used	Applications were made to two $4 \times 4 \text{ cm}^2$ intact and abraded test sites; details were not provided	Not irritating	58
			Human		
		Pr	Propylheptyl caprylate		
Propylheptyl caprylate	Undiluted and 10, 25, or 50% in mineral oil 47.6 mg/cm <sup>2</sup>	22 subjects	Single 48-hour occlusive application; approximately 0.2 mL of each test material was applied using a 1.9 $\times$ 1.9 cm <sup>2</sup> patch	No dermal effects at any concentration	50

	Concentration/dose	Test population	Procedure	Results	Reference
		_	lsopropyl myristate		
lsopropyl myristate	Not specified	244 subjects with contact dermatitis	Patch testing occurred over a 3-year period with a series of test materials (details were not provided)	Three positive responses to isopropyl myristate	82
		_	Isopropyl palmitate		
Cream containing 10% isopropyl palmitate (described earlier)	0.1 mL	20 subjects	Human chamber scarification test; occlusive 23-hour patch; test material was applied to the abraded skin of the volar forearm daily for 3 days Paraffin oil was applied as the negative control and 0.5% aq SLS was used as the positive control; positive and negative vehicle control creams (described previously) were also tested Irritation was scored on a scale of 0.4 immediately prior to patch application and I hour after removal of the final patch	The test material was well-tolerated Clinical scores for the test material (2.71), the positive vehicle control (2.51), and the negative vehicle control (2.39) as assessed by AUC (given as the geomean; study days were plotted on the x-axis and average clinical score on the y-axis) were greater than that of the negative control (2.17), but the differences were not statistically significant Clinical score of the positive control was 5.29	4
			Ethylhexyl laurate		
2-Ethylhexyl esters of C8-14 fatty acids	50% and undiluted	10 subjects	Open epicutaneous test; test substance was applied for 60 minutes (additional details were not provided)	Not irritating at either concentration	56
2-Ethylhexyl esters of C8-14 fatty acids	25%, 50%, and 100%	20 subjects	Closed epicutaneous test; applied for 24 hours under an occlusive patch (additional details were not provided)	25% and 50%: no reactions observed 100%: slight erythema, 3 incidences of moderate edema, and 1 of slight edema were observed	56
		D	Dermal sensitization		
			Nonhuman		
		Pr	Propylheptyl caprylate		
Propylheptyl caprylate	0%, 2%, 10%, and 50% in corn oil	Mouse	LLNA	Not a sensitizer A lymphocyte proliferative response was not induced	50

Economic Cooperation and Development; SLS, sodium lauryl sulfate.

whether the testing was done in rats or in rabbits, 30% isodecyl laurate in liquid paraffin was not a dermal irritant.<sup>58</sup> Propylheptyl caprylate, which was moderately irritating in rabbit skin, was not irritating to human skin when applied for 48 hours using an occlusive patch.<sup>50</sup> In other clinical tests, patch testing with isopropyl myristate resulted in 3/244 positive reactions in subjects with suspected contact dermatitis<sup>82</sup> and a formulation containing 10% isopropyl palmitate, which was moderately irritating to guinea pig skin, was well tolerated in a human chamber scarification test.<sup>77</sup> Undiluted and 50% 2-ethylhexyl esters of C8-14 fatty acids applied openly for 60 minutes, and 25% and 50% applied with an occlusive 24-hour patch were not irritating, but undiluted 2-ethylhexyl esters of C8-14 fatty acids produced slight erythema and moderate edema when applied with an occlusive 24-hour patch.<sup>56</sup>

The alkyl esters were not sensitizers in nonhuman or human studies. In a mouse local lymph node assay, propylheptyl caprylate did not induce a lymphocyte proliferative response, indicating that it is not a sensitizer.<sup>50</sup> Ethylhexyl laurate<sup>56</sup> and isodecyl laurate<sup>58</sup> were not sensitizers in a guinea pig maximization test. In clinical testing, butyl oleate was not a sensitizer in a maximization study<sup>83</sup> and a body oil containing 77.9% ethylhexyl palmitate,<sup>84</sup> a lip gloss containing 25.9% ethylhexyl stearate,<sup>85</sup> an eyebrow pencil formulation containing 38.8% ethylhexyl stearate,<sup>86</sup> a concealer containing 29.5% isocetyl myristate,<sup>87</sup> and a lipstick formulation containing 15.2% cetyl ricinoleate<sup>88</sup> were not sensitizers in human repeat insult patch tests (HRIPTs).

### Ocular Irritation

*Propylheptyl caprylate.* The ocular irritation potential of propylheptyl caprylate was evaluated in 3 female rabbits.<sup>50</sup> Slight conjunctival irritation was observed in all animals 1 hour after instillation, and the irritation had increased to a more diffuse response in 1 animal at 24 hours after instillation. All effects subsided within 72 hours for 2 of the animals and by 7 days in the third animal. Propylheptyl caprylate was considered slightly irritating to rabbit eyes.

*Ethylhexyl laurate*. Ethylhexyl laurate was not irritating to rabbit eyes.<sup>56</sup> Additional details not provided.

*Isodecyl laurate.* A study was conducted in New Zealand white rabbits to determine the ocular irritation potential of 10% isodecyl laurate in liquid paraffin.<sup>58</sup> No significant treatment-related ocular lesions were observed. No additional details were provided.

# **Miscellaneous Effects**

## Dermal Effects

*Isostearyl isostearate.* In a clinical study, a determination of skin surface water loss, measured using a plastic occlusion stress test, indicated that isostearyl isostearate (2 mg/cm<sup>2</sup>, applied neat) improved the stratum corneum water permeability barrier

function.<sup>89</sup> The researchers hypothesize that the improvement was due to effects on stratum corneum lipid phase behavior.

# Summary

In 1997, the Expert Panel concluded that cetyl esters was safe as used in cosmetics. Because cetyl esters is a member of a broader group of 237 cosmetic ingredients having structural and functional similarities, that is, the alkyl esters, all of these ingredients are included in this rereview. Although 57 of the alkyl esters have been reviewed previously by the CIR, they are included so that a complete family has been formed. The alkyl esters consist of the reaction products of fatty acids and alcohols, and the core relationship between these ingredients is a carboxyl ester functional group flanked on both sides by alkyl chains. Some of these alkyl chains are straight and some are branched. Ingredients included in the safety assessment are primarily reported to function in cosmetics as skinconditioning agents.

Most of these alkyl esters are produced synthetically via classical Fischer type esterification methods. However, some of the natural source ingredients in this review may be produced by transesterification. Alkyl esters are hydrophobic materials that range from oils at the lowest molecular weights/shortest chain lengths to waxy solids at the highest molecular weights/longest chain lengths.

The VCRP data obtained from the FDA in 2013 and data received in response to a survey of the maximum reported use concentration by category conducted by the Council indicate that 112 of the 237 alkyl esters named in this safety assessment are used in cosmetic formulations. Ethylhexyl palmitate has the most reported uses, 1525, followed by isopropyl myristate, 1182 reported uses, and isopropyl palmitate, 1125 reported uses. Ethylhexyl palmitate had the highest reported use concentration at 78% in body and hand preparations, followed by isopropyl myristate, which is used at 77.3% in other hair grooming aids and 76.6% in aerosol hair spray formulations. Isoamyl laurate and butyl stearate are approved as a direct food additives and a number of the alkyl esters are approved as indirect food additives.

In rats fed a diet containing 20% cetyl oleate, absorption of cetyl oleate was reported to be 75.3%. All the animals developed seborrhea. The absorbability and seborrhea suggested that cetyl oleate was not hydrolyzed in the gut.

Isopropyl myristate is a nonpolar penetration enhancer in pharmaceutical and cosmetic preparations. Isopropyl palmitate is reported to be used in topical formulations as a lipid layer penetration enhancer. Isostearyl isostearate increased the rate of penetration of fluorouracil through excised human abdominal skin, but it was not a penetration enhancer. Alkyl esters tended to increase the permeation rate of indomethacin and ketoprofen, the increase occurred due to increased solubility.

The dermal  $LD_{50}$  of butyl oleate in rabbits was >5 g/kg, and the dermal  $LD_{50}$  in rats of propylheptyl caprylate and ethylhexyl laurate was >2 and >3 g/kg/bw, respectively. The oral  $LD_{50}$  in rats was >5 g/kg for butyl oleate and for cetyl myristoleate, >2 g/kg for propylheptyl caprylate and ethylhexyl laurate, >13 g/kg for isodecyl oleate, and >64 cm<sup>3</sup>/kg for isopropyl linoleate. The inhalation  $LC_{50}$  of ethylhexyl laurate in rats was >230 ppm. In repeated dose studies in rats, toxic effects were not observed with oral administration of up to 1000 mg/kg ethylhexyl laurate or 4500 mg/kg/d isodecyl laurate for 4 weeks or with up to 1000 mg/kg bw/d propylheptyl caprylate for 90 days.

Propylheptyl caprylate was not mutagenic in an Ames assay ( $\leq$ 5.0 µL/plate) or clastogenic in an in vitro mammalian chromosomal aberration assay ( $\leq$ 2480 µg/mL). Ethylhexyl laurate and isodecyl laurate were not mutagenic toward *S typhimurium* in an Ames assay at doses of  $\leq$ 5000 µg/plate, and ethylhexyl laurate,  $\leq$ 5.0 mL/kg, was not genotoxic in a mouse micronucleus test.

Mixed results were reported in nonhuman irritation testing using some alkyl esters. In rabbits, propylheptyl caprylate was moderately irritating and ethylhexyl laurate was not irritating. A formulation containing 10% isopropyl palmitate was moderately irritating in male hairless guinea pigs. In one study in which it was unclear from the report whether the testing was done in rats or in rabbits, isodecyl laurate was not irritating to the skin. In a mouse local lymph node assay, propylheptyl caprylate did not induce a lymphocyte proliferative response, indicating that it is not a sensitizer. Ethylhexyl laurate and isodecyl laurate were not sensitizers in a guinea pig maximization test.

Mixed irritation results were also observed in human studies. Propylheptyl caprylate, which was moderately irritating in rabbit skin, was not irritating to human skin when applied for 48 hours using an occlusive patch. Patch testing with isopropyl myristate resulted in 3/244 positive reactions in subjects with suspected contact dermatitis. A formulation containing 10%isopropyl palmitate, which was moderately irritating to guinea pig skin, was well tolerated in a human chamber scarification test. Undiluted and 50% 2-ethylhexyl esters of C8-14 fatty acids applied openly for 60 minutes and 25% and 50% applied with an occlusive 24-hour patch were not irritating, but undiluted 2-ethylheyxl esters of C8-14 fatty acids produced slight erythema and moderate edema when applied with an occlusive 24-hour patch. No sensitization reactions were observed in human studies. Butyl oleate was not a sensitizer in a maximization study and a body oil containing 77.9% ethylhexyl palmitate, a lip gloss containing 25.9% ethylhexyl stearate, an eyebrow pencil formulation containing 38.8% ethylhexyl stearate, a concealer containing 29.5% isocetyl myristate, and a lipstick formulation containing 15.2% cetyl ricinoleate were not sensitizers in HRIPTs.

Ocular irritation studies were performed using rabbits. Cetyl esters, 60% to 65%, ethylhexyl laurate, 10% isodecyl laurate in liquid paraffin, and 10% isopropyl laurate in corn oil were not irritating to rabbit eyes and undiluted and 10% aqueous isopropyl linoleate and propylheptyl caprylate was slightly irritating to rabbit eyes.

## Discussion

This CIR Expert Panel expanded its earlier safety assessment of cetyl esters to include all alkyl esters currently described as cosmetic ingredients based on similarities in molecular structures, physical and chemical properties, and usage in cosmetics. These ingredients consist of the reaction products of fatty acids and alcohols.

Although there are data gaps for individual ingredients, there are adequate data on many of the ingredients, and the relatedness of molecular structures, physicochemical properties, and functions and concentrations in cosmetics noted above allowed grouping these ingredients together and extending the available toxicological data to support the safety of the entire group. For example, dermal absorption and metabolism data for certain long-chain, branched alkyl esters were lacking. The consensus of the Panel was that earlier safety assessments had determined that dermal penetration of long-chain alcohols is predicted to be low, so the Panel extended that information to suggest that dermal penetration for alkyl esters is likely to be even lower. The Panel recognized that some of the alkyl esters can enhance the penetration of other ingredients through the skin. The Panel cautioned that care should be taken in formulating cosmetic products that may contain these ingredients in combination with any ingredients whose safety was based on their lack of dermal absorption data or when dermal absorption was a concern.

The Panel acknowledged that some of the alkyl esters may be formed from plant-derived or animal-derived acid or alcohol constituents. The Panel thus expressed concern regarding pesticide residues and heavy metal that may be present in botanical ingredients. They stressed that the cosmetics industry should continue to use the necessary procedures to sufficiently limit amounts of such impurities in an ingredient before blending them into cosmetic formulations. Additionally, the Panel considered the dangers inherent in using animal-derived ingredients, namely the transmission of infectious agents. While tallow may be used in the manufacture of some ingredients in this safety assessment and is clearly animal derived, the Panel notes that tallow is highly processed and tallow derivatives even more so. The Panel agreed with determinations by the US FDA that tallow derivatives are not risk materials for transmission of infectious agents.

The Panel was also concerned that the potential exists for dermal irritation with the use of products formulated using some of the alkyl esters. The Panel thus specified that products must be formulated to be nonirritating.

Although a previous CIR safety assessment on isopropyl linoleate determined that the data were insufficient to determine safety for use in cosmetics and that human irritation and sensitization data and genotoxicity data were needed, the Panel reexamined that finding. Because it is now stated that products containing alkyl esters must be formulated to be nonirritating, irritation data are no longer needed for isopropyl linoleate. Sensitization data were available for other alkyl esters, suggesting that sensitization would not be a concern for isopropyl linoleate. Likewise, the Panel concluded that the genotoxicity data were available on a number of structurally analogous compounds, suggesting an absence of genotoxicity for isopropyl linoleate.

The Panel also noted that although no carcinogenicity data were available, the negative genotoxicity data coupled with the fact that dermal penetration is expected to be low supports the Panel's view that carcinogenicity would not be a concern with cosmetic use of alkyl esters.

The Panel discussed the issue of incidental inhalation exposure to alkyl esters from powders and products that may be aerosolized. Some of the alkyl esters are reportedly used at up to 19% in products that may become airborne (ie, in face powders), and at quite high concentrations in cosmetic products that may be aerosolized (eg, 77% isopropyl myristate in hair sprays, 45% ethylhexyl palmitate in indoor tanning preparations, and 23% isopropyl myristate in deodorant formulations). There were no repeated-dose inhalation toxicity data available for the alkyl esters; however, the actual exposure in the breathing zone is small and given the concentrations at which the ingredients are used, the available information indicates that incidental inhalation would not be a significant route of exposure that might lead to local respiratory or systemic effects. Also, these ingredients are large molecules and most are quite insoluble in water, which supports the view that they are unlikely to be absorbed or cause local effects in the respiratory tract. The Panel also considered the data available to characterize the potential for alkyl esters to cause systemic toxicity, irritation, sensitization, or other effects, and concluded that ingredients of this family tend not to produce systemic toxicity at high doses in single-dose oral, dermal, or inhalation studies and not to produce significant systemic toxicity in oral repeated-dose studies. A detailed discussion and summary of the Panel's approach to evaluating incidental inhalation exposures to ingredients in cosmetic products that may be aerosolized is available at http://www.cir-safety.org/cir-findings.

# Conclusion

The CIR Expert Panel concluded that the alkyl esters, listed subsequently, are safe in the present practices of use and concentration described in this safety assessment when formulated to be nonirritating.
